FOREVER NEEDLE

ALZHEIMER - What really helps

In this book, Ulrich Werth, a medical doctor and brain researcher, uses 13 case studies to prove that Alzheimer's can be cured completely effectively and permanently with the implanted ear acupuncture. He developed the Forever Needle Therapy.

He also draws on the results of his groundbreaking thesis from 1975. Since the materialistic explanation of that time was not sufficient, he concluded that the brain and the morphic field were a whole, thereby establishing a new universal worldview.

The Frenchman Paul Nogier discovered that the entire body is represented upside down on the auricle. There is a corresponding point or area on the ear for every tissue, brain region and organ part.

The Forever Needles are dipoles that receive non-ionising electromagnetic rays, the energy of space. According to various studies, these rays are able to penetrate and energise biological structures. The special feature of the Forever Needle Therapy is that by placing the titanium tips on the corresponding areas of the auricle, all brain and body regions are supplied with zero-point energy (free energy / space energy) and information via the finest energy pathways (microtubules according to Fritz Albert Popp).

Authors

Ulrich Werth MD, is a specialist in neurology and psychiatry (according to German law) and a co-founder of neurobiology. He discovered his passion for acupuncture in his medical practice in Magdeburg. He also went to Beijing/China for acupuncture training to see for himself the „miracle cures“ that are impossible from a European point of view. Among other things, he received diplomas as an acupuncturist from the German Medical Association for Acupuncture and the European Academy for Aurikulo Medicine. He also holds acupuncture certificates from Spain, Chile, Switzerland and India. Through his passionate commitment to understanding Chinese medicine and selecting and hitting the right acupuncture points, he became the legendary „needle piercer of Magdeburg“ and gave acupuncture lectures at the Medical Faculty of Otto von Guericke University Magdeburg. In 2001, he presented the therapy he had discovered with the Forever Needles for the first time at the World Congress of Acupuncture in Berlin. Since 2007 he has been working in Spain. First in Valencia and now with his acupuncture practice in Mallorca. In the meantime, he has treated about 7000 patients with the Forever Needles, about 6000 of them with Parkinson's disease. Since he has been working as a passionate doctor for his patients for 50 years now has accumulated a very extensive knowledge in this time, he can successfully treat many diseases with the Forever Needles. He speaks German, Spanish, Russian and English. He has given lectures and seminars in Santiago de Chile, Bogota (Colombia), Ottawa and Toronto (Canada).

Iris Görke has a degree in business administration with a focus on marketing, graphic and web design and is a future alternative healer. In the joint practice in Mallorca, she is responsible for the organization, marketing and assists with the treatments.

Preface

For 14 years I have been practising the successful Forever Needle Therapy, which has reversed Parkinson's disease in thousands of patients around the world. All this time I had not thought of Alzheimer's disease. Although I should have known about it, as a co-founder of neurobiology, a brain researcher and with my thesis on the mechanisms of short-term memory, which is still relevant today, it was only in 2014 that the daughter of an Alzheimer's patient told me that it must also help her mother.

For a long time the constant disputes and necessary justifications against the smear strategy of the pharmaceutical lobby, which dragged me through the mud as the inventor of an unrivalled curative therapy, had prevented me from taking a step back and thinking clearly: Then it must be all the more helpful for Alzheimer's. After all, the plasticity of the nervous system is greatest in the brain regions affected by Alzheimer's. In the meantime, I knew from thousands of patient reports that the treatment had only positive and never negative effects.

The incredible success with extremely advanced Alzheimer's to the point of complete remission with full recovery of the life I led before not only made me think about a lot of what is going on in the world and the manipulative mainstream media we are exposed to. I started to look at the world with different eyes. The devil is not just in the details. No, worse than that, he meets us at every turn. So be on your guard!

Soon it became even more blatant: The 24-hour healing of Peter Kaess, the healing in seconds of a Turkish Alzheimer's patient in the final stages, and the "clicking into the world" of a painter who also came to during the treatment, brought my previous knowledge of the brain into a serious problem of explanation. The processes I registered in the brain as the basis of

short-term memory always took more than 15 minutes. Compared to the success of Alzheimer's from 0% to 100%, this was far too long. After 50 years I had to completely abandon the purely materialistic view. As time went on, I realised more and more: "There are things between heaven and earth that blatantly contradict the narrow view of the previous school of wisdom (loosely based on Shakespeare)". Gradually, as a scientist, I had to acquire a "more universal view of the world".

13 case studies support the following theses:

- It is not the materia in the form of the morphology of the brain that is primary or the cause of Alzheimer's disease. But the mind in the form of the untrained brain function is primary. It determines the morphology of the brain.
- Harmful influences of the most diverse levels can lead to the disconnection of the spirit from its material counterpart in the brain.
- The Forever Needle Therapy can restore the coupling of the spirit with the help of the "receiver brain" by receiving energy and information.
- The memory itself cannot be localised in the brain, as decades-old neurobiological experiments had proven.
- Alzheimer's can be cured if it does not involve mixed dementia with significant destruction of important parts of the brain.
- Shrinkage of other brain parts with memory disorders is also curable if no major parts of the brain have died.
- 10,000 Alzheimer's researchers were on the wrong track because they followed the money with the help of vaccination and not the truth and cure.

Ulrich Werth MD, Mallorca 2023

What is dementia and what is Alzheimer's disease?

Definition of dementia

Dementia is a general term for a decline in mental abilities that is severe enough to interfere with daily life. Memory loss is one example. Conventional medicine considers Alzheimer's disease to be the most common form of dementia.

The exact demarcation of Alzheimer's disease as a specific form of dementia is usually not made in the various epidemiological sources. There is no single definition of Alzheimer's disease because the boundaries between Alzheimer's disease and other dementias are blurred. The only consensus is that Alzheimer's disease is characterised by the progressive death of nerve cells in the brain, which ultimately leads to death.

In 1906, the German psychiatrist, neuroanatomist and neuropathologist Alois Alzheimer described the disease that bears his name. He had a patient, Auguste Deter, who was confused and forgetful. She said to him: "I have lost myself, so to speak...". Alois Alzheimer accompanied her until her death at the age of 56. The autopsy revealed a marked shrinkage of the brain. Alois Alzheimer also found protein deposits between the nerve cells.

What is "pure Alzheimer's"?

We have brought the term "pure Alzheimer's" to the fore because our "Forever Needle Therapy" is certain to be effective in this case. By "pure" Alzheimer's we mean the loss of mental ability, no matter how advanced.

If there is evidence of shrinkage (= atrophy) of the brain, especially the hippocampus and temporal lobe. This shrinkage can be seen on an MRI (magnetic resonance imaging) scan. We emphasise this definition because this is where treatment is most successful.

Prevalence of Alzheimer's disease

After its first description in 1906, Alzheimer's disease hardly appeared in pathology books. This suggests that it was a rare disease. However, by 2021 there will be 1.8 million people with dementia in Germany. The rate of new cases is rising steadily. Official sources have therefore spoken of the pandemic of the 21st century.

Causes of Alzheimer's disease

Statistically the incidence of Alzheimer's disease increases with age. However, age cannot be regarded as the cause of the disease. There are plenty of examples of centenarians who had amazing mental capacity. The discoverer of the Nash equilibrium, John Nash, best known for the film "A Beautiful Mind", was still lecturing at university at the age of 90. Europe's oldest registered citizen, Jeanne Calment, who died at the age of 122, showed no signs of dementia up to the time of her death.

Other factors are therefore responsible for the onset of Alzheimer's disease:

- Lack of use
- Lack of mental challenge
- Lack of social contact
- Emotional distress

- Lack of coping with emotional trauma
- Lack of physical fitness
- Medication, e.g. antacids containing aluminium, etc.
- Toxins such as aluminium, mercury compounds and other toxins

In the past, an immunological cause was discussed. The key finding, which the book illustrates with case studies, is that:

**The sword of Damocles, Alzheimer's disease, loses its terror
because it can be reversed or cured by the Forever Needle Therapy.
And this is without any detailed knowledge of the causes,
which are certain to interact.**

What types of dementia are there?

Alzheimer's disease can be distinguished from other forms of dementia according to the cause of the damage and the region of the brain affected. The implications for treatment are that different regions of the brain have different regenerative capacities due to different types of nerve cells.

All types of brain damage can lead to dementia if the damage is extensive. In pure Alzheimer's disease, the hippocampus and the temporal lobe are particularly affected. In other forms of dementia other parts of the brain, such as the frontal lobe, are damaged. Damage to the frontal lobe of the brain particularly affects the local functioning of action processes, planning thinking and formally organised speech. Such a case is described as a case study in this book. We have reported success in the patient's own words after treatment compared to the altered function before. Other

functional disorders occur according to Brodmann's map of locations on the cerebral cortex. Depending on the type and extent of the damage, these can be repaired by implanting the mini titanium needles in the appropriate locations on the pinna.

When can the Forever Needle Therapy be of little or no help?

Other forms of dementia are thought to be caused by damage to the brain. These include damage caused by stroke, trauma to the head after an accident, death of brain tissue due to circulatory problems with the formation of scar tissue, death of brain tissue due to radiation damage, and so on. Depending on their extent, they can limit the success of the Forever Needle Therapy.

To be able to assess whether or not there is a limit to the success of the treatment, I need an MRI of the head and therefore of the brain. This is important for relatives or patients who come to us for treatment. The tiny titanium needles implanted in the auricle can never do any harm. But you should still let me assess the expected success beforehand, if possible.

Meaning function and structure

For conventional medicine, most functional disorders of the brain are incurable. From the point of view of conventional medicine, brain atrophy is the cause, not the consequence, of untrained mental functions. The Nuns' Study also showed that conventional medicine confuses cause and effect. This may not only be ignorance but also arbitrariness to justify incurability and the alleged lack of research.

In our case studies, the recovery of mental function occurs before the brain can grow. We know that this takes longer. The brain's ability to form new neurons from stem cells is denied altogether. In 1998, Eriksen had already demonstrated "adult neurogenesis", i.e. the formation of new nerve cells in the adult brain.

The pharmaceutical industry was on the "wrong track"

The pharmaceutical industry is said to have spent 100 billion euros on Alzheimer's research but has found nothing that could somehow cure the disease. The German newspaper Süddeutsche Zeitung wrote a few years ago: "Alzheimer's research is the pharmaceutical industry's greatest frustration".

The mainstream media systematically panicked people. This was done by spreading the Alzheimer's lie, which is: "You just have to get old enough, then you can wait to get Alzheimer's." This Alzheimer's lie is obvious because there are plenty of old and mentally fit people. Ultimately, the Alzheimer's lie was designed to scare and manipulate people into accepting a vaccine that made no sense to them. A few years ago, the Alzheimer's vaccine was still in the tabloids and was supposed to work against the so-called plaques. However, it was already known at that time that these amyloid plaques are present in every mentally fit older person without pathological (disease-causing) significance and cannot be the cause of Alzheimer's disease.

Alternative explanations and treatments

Gerald Hüther, in his book "Out of the dementia trap", describes the Nun's study, which states that the brain can perform the same functions with plaques as without.

Michael Nehls, in his books "The Alzheimer's lie" and "Alzheimer's is curable", identifies important parts or factors in the development of Alzheimer's. He is a drop-out from the Alzheimer research projects that have now also been discontinued, i.e. the end of the pharmaceutical industry's greatest frustration, as the *Süddeutsche Zeitung* reported with great pity for the employees and researchers of the pharmaceutical industry.

Dale Bredeisen achieved a significant improvement in the quality of life of 9 out of 10 patients after two years of intensive treatment and lifestyle coaching. The dementia specialist and professor of neurological psychiatry at Saarland University wanted to put this into practice. He was rejected because it was ineffective and society could not afford it. We are critical of Dale Bredeisen, although he has good approaches because he praises the glutamate antagonist "Memantin" as a conventional medicine and promotes it for the pharmaceutical industry. According to my brain research for my thesis and our practical experience with patients, "Memantin" leads to a deterioration in the memory performance. In my doctoral thesis, I was able to demonstrate the extremely positive effect of glutamate on information storage (see below "On the trail of short-term memory"). "Memantin" displaces glutamate from the receptors.

Much more effective, of course, is the treatment of Alzheimer's with the Forever Needle Therapy described here. What Dale Bredeisen was able to achieve with great effort in two years, namely the recovery of cognitive

abilities in Alzheimer's patients, has been proven to happen very quickly with the Forever Needle Therapy. Sometimes it happens during the treatment, sometimes it takes 24 hours, sometimes it takes weeks. Usually, one treatment from me is enough.

The reconfirmed aluminium hypothesis in Alzheimer's

Despite Michael Nehls' otherwise enlightening and insightful books, one important cause is forgotten. Read the book "Dirty Little Secret - The Aluminium File" by Bert Ehgartner. Aluminium forms triple positively charged ions is a very small atom and therefore has a large electrical connectivity (atomic attraction). This attraction changes the spatial configuration of protein molecules. But they cannot function if the configuration is changed. This leads to profound changes in the functions of living structures. Proteins form the basis of all life. For example, our human immune system is made up entirely of proteins (albumin and globulins). Aluminium is therefore not only harmful to the brain.

In the brain, aluminium causes the following damage:

- When it enters the nerve cells, it lowers the resting potential, which is vital for the nerve cell, because aluminium has a triple positive charge and the cell must be negatively charged inside to be able to fulfil its function.
- Of course, the destruction of the protein configuration also plays a role in the nerve cell.
- In the nerve cell (as in all other cells) it displaces ATP, the body's main source of energy. In the nerve cell, ATP is needed to constantly build up the resting potential so that it can function at all.

The amount of aluminium in the air has multiplied in recent years. I had a young couple who were poisoned by aluminium, strontium and barium and they said they got it from a top-secret job. They had to make paraffin additives for aviation fuel. This is not an insignificant source of the increase in Alzheimer's disease, given the number of aeroplanes in the sky. In addition, many waterworks use aluminium to purify drinking water because it is very reactive and combines very quickly with other particles. Pure aluminium is therefore never found in free form. Aluminium is also found in many vaccines, antacids and other conventional medicines. Years ago, increased aluminium levels were found in the brains of dialysis patients.

I was asked about the aluminium hypothesis for Alzheimer's disease during my specialist examination in neurology and psychiatry in 1989. I was able to answer that there was more aluminium in the nerve cells of Alzheimer's patients than in healthy people. Today, the aluminium hypothesis for Alzheimer's has been completely discredited. Only recently, Konrad Beyreuther, in a recent study using new research methods, once again proved the aluminium hypothesis in Alzheimer's disease. Aluminium compounds can cause symptoms in the nervous system, such as memory and speech disorders and listlessness. The Alzheimer's associations still deny this link.

The pharmaceutical glutamate lie

The pharmaceutical glutamate lie is that glutamic acid, as a powerful excitatory transmitter, overexcites nerve cells to the point where they die. If this were true, it would be much easier to fix by giving high doses of vitamin B6. Vitamin B6 activates glutamate decarboxylase. This is a bio-enzyme that promotes the conversion of the excitatory glutamate into the inhibitory gamma-aminobutyric acid. The body would then be better able to balance the two transmitters. Pathophysiologists know that this also plays a role in epilepsy and sleep disorders caused by overexcitation of nerve cells.

In my doctoral thesis in 1975, I was able to show that the transmitter glutamic acid plays an extremely important role in learning and memory processes. In the absence of glutamic acid, learning and memory are virtually impossible. The drug "Memantin", which is prescribed to Alzheimer's patients, counteracts the transmitter glutamic acid and thus leads to a deterioration in memory performance.

What sense does conventional medicine still make?

I would like to bring awareness to this issue through a dialogue I had with Iris and encourage you to continue to do it yourself at home since I cannot answer everything exhaustively here.

Here is what happened:

I wanted to hear a critical video on the subject of conventional medicine. In this interview, the video begins with the words: "Modern conventional medicine has achieved great things..." I immediately switched off and explained to Iris:

"When they start like that, they are not on my wavelength, even if they normally could be." I added: "I'm sure he's just afraid of falling into the hands of conventional medicine himself one day and doesn't want to mess things up with these people."

Iris: "You were a school doctor yourself. Think about it, isn't there something positive about it?"

Me: "I examine patients clinically with my sense organs because I can also look back on 50 years of being a doctor with the constant search for truth and healing."

Iris: "Would you then know so much today if there had never been conventional medicine?"

Me: "What do you mean? I see with my experience what is going on with the patient. And when I've let him talk, when he's answered all the questions I have and when I've examined him with my simple instruments like hammers and stethoscope, then I know what must be in his findings of technical medicine."

Iris: "Yes, but would you know it now if you hadn't seen electroencephalograms, electromyograms, MRIs and laboratory blood tests in parallel to the patient's examination for decades?"

Me: "Well, you're right. If the examination results of technical medicine had never been presented to me in the past, I wouldn't be able to guess what's in there today. All right, I want to recognise the diagnostics of conventional medicine and I also see a great sense in it for most doctors who don't have so much experience yet. But what is going on today that young doctors only rely on the apparatus? I therefore think that this no longer has anything to do with being a real doctor. For example, a patient comes in moaning in pain or other complaints, and I can tell by the knowledge of human nature I have acquired in the meantime that he really must have these complaints. But the machines don't show anything. Should I consi-

der this patient, who is suffering, as a malingerer or even send him to the psychiatric ward? No, I won't do that," I said energetically.

Iris: "Yes, I understand you. But you have to put everything in perspective. Everything has its justification in proportion."

Our discussion later turned to emergency medicine. Iris defended conventional medicine by saying: "What if I hadn't had my appendix removed? I wouldn't have been here." So she gave me more examples where I had to admit defeat and accept the diagnosis of conventional and emergency medicine.

It was a very interesting and constructive dialogue. Feel free to continue it at home.

My last will: Give me a pill

Another thing I was right about was the misuse of medicines. I originally wrote my doctoral thesis in pharmacology and also completed three years of specialist training in pharmacology. This is why I am particularly interested in the mechanisms of action of drugs that are often prescribed carelessly in conventional medicine. Stomach acid blockers containing aluminium have been prescribed or at least taken by patients for decades. It is then no wonder that the patient later suffers from Alzheimer's disease because aluminium in the brain is a cause of Alzheimer's disease.

Statins are prescribed as so-called cholesterol-lowering drugs and in fact, only have the effect of generating billions of dollars in sales for the pharmaceutical industry because people are afraid of cholesterol due to scaremongering by the mainstream media. Statins suppress Q10, which is important for energy production, so statins make people weak.

Most doctors don't even know that the ratio of LDL cholesterol to HDL cholesterol is important. But prescribing pills is in. Not a few patients are so medically illiterate that they think they are faking it or that they are getting a bad deal if they leave the doctor's practice without a prescription. The fact that you can be healthy and vibrant with a lifestyle, exercise, a healthy diet, avoiding stress and a meaningful activity is lacking as knowledge. Or, if the knowledge is there, the will to put it into practice.

If the food in the supermarket is unhealthy, you have to go to the organic shop. Then there are supplements such as amino acids, multivitamins and trace elements to support health. Magnesium also lowers stress levels by constricting calcium channels and reducing the hyperexcitability of nerve cells. Omega-3 unsaturated fats are also part of a healthy diet. On the other hand, sugar and carbohydrates should be avoided.

I have myself to thank for the fact that due to hard sports training and the avoidance of large amounts of carbohydrates and sugar, I am now an estimated 20 years younger than my chronological age.

The conventional medical theory

The neocortex as an infinite memory store

The neocortex consists of 100 billion nerve cells, each connected to the next by 100 to 100,000 synapses. The neocortex, the newer part of the cerebral cortex, also known as the brain's shell, is considered to be an infinite storehouse of memory. In humans, it is the largest of any living creature. Only the dolphin's brain comes close. This network of nerves is so complex that it can be compared to the universe. The synaptic connections constantly change the transmission efficiency from one nerve cell to the next downstream cell, depending on use or disuse. Disuse causes the pathways to atrophy and regress.

Illustration of the neocortex (new cerebral cortex), which is so highly developed and large in humans, with its four lobes and many convolutions: The frontal lobe for the organisation of action processes including motor speech formation, the parietal lobe with body perception, the temporal lobe with acoustic perception and speech comprehension, and the occipital lobe with the visual cortex.

The hippocampus and its connection to the neocortex

The hippocampus became the focus of memory research following a neurosurgical case in 1953 involving Henry M., an epileptic patient. Henry M. had epilepsy and the excitation came from the hippocampus. So the neurosurgeon decided to separate the hippocampus from the rest of the brain. From then on, the connection between the so-called "tractus perforans" and the rest of the cerebral cortex, which we call the neocortex, the part of the brain that is particularly developed in modern neo-humans, with its many twists and turns, was missing. As a result, Henry M. could no longer remember anything. At the age of 70, he still said he was 19. He had the operation when he was 19.

At the bottom of the brain is the hippocampus, shown here in orange, which resembles a seahorse. It is the oldest part of the cerebral cortex. The hippocampus is connected to the limbic system, where emotions are felt.

One hypothesis about Alzheimer's is that the connection between the hippocampus and the infinite memory of the cerebral cortex is broken. This hypothesis is contradicted by our success in curing Alzheimer's. If the connection between the hippocampus and the cerebral cortex is indeed broken, there is no way that the Forever Needles could restore it in such a short time.

Biochemical and cellular basis of Alzheimer's disease

At the cellular level, Alzheimer's researchers have come up with the following hypothesis: The hormone cortisol, which is released under extreme stress, such as fear of death, leads to an extreme release of glutamate in the nerve cells of the hippocampus. This excites the nerve cells to such an extent that the cells' energy reserves in the form of ATP (adenosine triphosphate) are not sufficient to keep the cell alive. This is thought to lead to the destruction of cells in the hippocampus, including its connection to the neocortex. The role of glutamate in this theory has led to the glutamate antagonist "Memantin". However, the relatives of Alzheimer's patients in our practice have reported improvements in the mental performance of the patients after discontinuing "Memantin". This hypothesis is therefore not supported by our experience.

Another hypothesis is that when nerve cells are highly excited, the enzyme gamma-secretase produces β -amyloid, a molecule that reduces excitability. Amyloid means "sticky". Its property is that all these molecules stick together. Eventually, this is supposed to lead to a lack of this inhibitor and, in turn, to further over-excitation of the hippocampal neurons, causing them to die. The hippocampus of Alzheimer's patients is reduced in size in MRI images. However, it is unlikely to have increased in seconds, minutes,

or 24 hours after Forver Needle Therapy. Such a growth has completely different time parameters. So this theory cannot explain the successes of Forever Needle Therapy.

The oligomers, i.e. several bonded molecules of the β -amyloid, continue to bond to form the plaques. These are tiny “globs” of β -amyloid stuck together. These no longer react in any way with nerve tissue and are therefore no longer relevant to Alzheimer’s disease. They’re also present in older people without Alzheimer’s disease, the Nuns’ study showed. Still, there was a kind of gold rush mood in the ranks of the pharmaceutical industry because they thought they had a vaccine against these by-product plaques. Luckily, the scaremongering in the mainstream media wasn’t enough to push humanity into such a pointless vaccination. All in all, you can see that there are many theories.

Sensational Alzheimer's cure with the Forever Needles

The world's first Alzheimer's patient can share
what it was like to have Alzheimer's
one day after treatment.

In 2018, 24 hours after a treatment session with the Forever Needles, Alzheimer's patient Peter Kaess reported what it was like when he was suffering from Alzheimer's the day before, how he struggled to remember, to find his way around, to get words out, to articulate himself.

According to the MMSE test, he had moderate to severe dementia before treatment. MMSE means "Mini Mental Status Examination". The test contains questions and tasks to assess spatial, temporal and situational orientation, to assess short-term memory, arithmetic and language skills and attention. Questions about place and time, a test of memory and arithmetic skills are asked and the ability to understand and implement courses of action is tested. For each question or task, there is a certain number of points if the answer is correct. The maximum score is 30. But anything under 28 is not dementia.

In Peter Kaess, the brain parts typical of Alzheimer's, the hippocampus and temporal brain, were significantly reduced in the imaging process. However, this did not prevent the cognitive functions from returning within hours of treating the ear acupuncture points that I had hit with the utmost precision with the tiny titanium tips.

In the morning, the day before the interview, he was treated. In the evening, his wife says in an interview, he “clicked into the world” again. He was “present” again. He became interested again in everything that was happening at the moment. Before, “everything was like in a fog,” both said.

The next day he reported that there had been a “quantum leap”. The morning after the treatment he had the feeling that a new life was beginning. He was immediately fit for everyday use again. The pending question of the need for care was no longer to be thought of. And he gradually began to remember the “parts of his life that were previously buried”.

According to the retest, he no longer had dementia 24 hours after treatment with the micro-implants left in the pinna, popularly known as „Forever Needles“. On the contrary, he was above average. He had the full score of 30 points, which is rarely achieved by “normal people”. They are usually a little under 30 points. I spontaneously decided to do a short interview with him, which was videotaped to capture this world sensation. Because it was the first time that someone was able to report what it was like when they HAD Alzheimer’s.

Literal transcript of the interview:

Me: “Hello, Mrs and Mr Kaess. You received the treatment yesterday, and there were a lot of things that hadn’t occurred to you at all. They couldn’t even articulate themselves properly. I can still remember it well because I don’t have Alzheimer’s myself. What happened or what do you want to start with?”

Mr Kaess: “Yes, yesterday it was very exhausting for me to give the answers. I had to find my way here too. My wife was there and said: There, we have to go up the stairs. It was very tiring to concentrate. Then we

were here and I had the treatment done, let myself be tortured.”

Me: “I also got an idea of your marital situation. The relationship is wonderful too. That’s also important for healing.” Mr Kaess nods.

Turning to Mr. Kaess’s wife, I say: “How would you then describe the success now?”

Mrs Kaess: “Yes, I say he was exhausted after the treatment and lay down first. But in the evening I had the feeling: Now he’s clicked back into the world. That’s how I felt. Suddenly he got interested in different things again. And before that, I had the feeling that everything was in a fog with him. Yes, that was it. I felt like he was there again. It was phenomenal. Yes, that’s it.”

Me to Mr Kaess: “Well, what do you say about the situation?”

Mr Kaess: “Yes, everything was still mixed up yesterday. But today when I got up I noticed it. Now it has, it was the quantum leap. I told my wife what I dreamed. It’s nice that I could...”

Me: “So that you were able to articulate yourself again?”

Mr Kaess: “Yes, that the words came out.”

Me: “The words you were looking for.”

Mr Kaess: “Yes, they were inside me, but they didn’t always come out.”

Me: “You told me you always wanted to remember something. Thoughts have gone in circles.”

Mr Kaess: “Yes, and that was particularly bad.”

Me: “Well, because you always wanted to remember something, but couldn’t.” Mr Kaess nods. “And how was that now?”

Mr Kaess: “Now it came out. I couldn’t articulate myself. My thoughts were trapped. I wanted to say something. I could still open my mouth, but nothing came out.”

Me: "Another Alzheimer's patient said: What was buried came back to the surface."

Mr Kaess: "Yes, you can put it that way."

Mrs Kaess: "Yes, Peter always said he was in a loop..." She shows a large circle with her finger. "And then he couldn't remember."

Me: "Well, he kept thinking about it."

Mrs Kaess: "Exactly! Yes, and this morning he said: I was in a loop again. But now I can say exactly what I dreamed. The sentence was: What is the name of the greatest roasted salt?" "Nonsense, but..." They both laughed.

Me: "An Alzheimer's patient said: I'm myself again. Can you put it that way?"

Mr Kaess: "I'm on my way."

Me: "Well, today we can only confirm that the short-term memory is working again."

Mr Kaess: "Yes."

Me: "And that's a big step forward."

Mr Kaess: "Yes."

Me: "That would mean that many Alzheimer's patients can get through the day again and therefore never have to go to a nursing home. That's something that the function of the cerebral cortex is now much better. Then we would also have to expect the brain to grow again. Because there has never been anything like it in the world." Mr Kaess nods.

Mr Kaess: "We want to prove to the world that the brain can grow again. That is my goal. Then you'd better look at the worse things afterwards. So you don't get scared." They both nod and laugh.

Me: "So, today you are talking about being here in the practice. Yesterday you didn't even think about it. Now we're doing this silly test. I wouldn't say I like tests because they lump everyone together. Yesterday you didn't know what year it was. Do you know now?"

Mr Kaess laughs: "Yes, I know that now, it's 2017. Yesterday I said it's 2014."

Me: "And do you know where we are?"

Mr Kaess: "Yes, in Valencia in Spain."

Me: "This is very fast progress. But I can justify it scientifically. I stimulate the corresponding points in the cradle of nerve cells. Stem cells become neurons. You're now the fifth Alzheimer's patient for whom this has worked. Thank you very much. We'll be in touch."

--- End of interview ---

A year later, Peter Kaess visited me again at my practice in Valencia. I interviewed him again. Among other things, he said that he is preparing for the B2 level exam in Spanish. This is important for those who doubt the durability of the ultra-rapid healing. Learning became Mr Kaess' hobby.

On our website, you can watch the first video immediately after the treatment and the second one a year later:

www.forever-needle.com/de/sensationelle-alzheimer-heilung.html

Other factors have had a positive effect on the patient Peter Kaess:

- A well-developed intelligence before the illness,
- a happy love relationship with his wife
- and a meaningful life purpose.

He was therefore also highly motivated to get well again.

13 case studies from my practice

Case 1 - The 75-year-old Colombian woman

On the 8th of December 2014, I experienced the then 75-year-old Colombian woman Graciela Forera de Santa together with her daughter. She is a case of complete regression of Alzheimer's disease within 8 months using the method I call "Auricular Brain Stimulation (ABS)" in scientific publications.

Situation and symptoms before treatment:

Graciela presented herself on 12/08/2014 and 12/09/2014 with her daughter or better, she was introduced by her daughter. Under the condition that the daughter was forbidden to answer, she did not know in which town she was. She didn't know how old she was. She didn't know what she ate for breakfast. She didn't know that she had arrived the day before. She didn't know that she had to come to me, the place of treatment in Bogota, and had to fly one hour within Latin America. She didn't know in which hotel she had slept. She hadn't remembered any of the emotionally important experiences of the past few years. She didn't know when she had celebrated her last birthday, nor what it was like, who were the guests. Only a few snippets of language came out that had nothing to do with the situation at all. Her daughter explained that she had been diagnosed with Alzheimer's for a year. Brain MRI showed atrophy of the temporal brain including the hippocampus. However, there was also a suspicion of microangiopathy (circulatory disorders in the brain). Her forgetfulness had been noticed long before the diagnosis. Graciela could not live alone. As her daughter reported, she had to take care of her. The daughter worked and was overwhelmed with the care. The very important decision "nursing home or no nursing home" was imminent.

The following treatment was then carried out on two consecutive days:

The first day: Forever Needle Therapy, also called "Regenerative Alzheimer's Therapy (RAT)" was carried out. Using a large number of micro-implants for continuous stimulation of the corresponding regions of the hippocampus, known according to the rules of ear acupuncture, the entire limbic system and the cerebral cortex, especially the parietal (vertex) and temporal brain according to neurological experience. These are the parts of the cerebral cortex that are affected first in Alzheimer's disease. The numerous mini-needles implanted in one session unfolded small signs of increased mental alertness on the first day after the treatment.

The second day: The second point, which I think is equally important, was the instructions given by the patient's family. The family was instructed to set daily mental tasks, initially at the lowest level, and to assess the correctness of the answers. Initially, small addition tasks, subtraction tasks, small multiplication tables and light short-term memories should be asked. At first only for the respective day, later also after experiences of the previous day. The tasks needed to never get more difficult so that Graciela mostly had a sense of achievement. The mutual joy of the patient's loving family was also seen as a therapy promotion. The family showed great respect and attentive care to the patient by diligently following the tasks. With the slow improvement and the small sense of achievement we experienced together, enthusiasm increased, which the patient reflected on.

Other consultations also took place:

The patient must have a "life purpose", hobby or whatever and cultivate it whenever she should be able to. A lot of fish, mediterranean food with

olive oil (only served cold), coconut oil for frying, chilli and turmeric (also as a curry) were recommended for nutrition. Carbohydrates, on the other hand, should be avoided. Furthermore, daily exercise, such as going for a walk and all light long-term stress, was recommended, which among other things leads to a better oxygen supply. A recommended dietary supplement was NADH to improve brain oxygenation as well. In addition, she should drink enough water in combination with two capsules of hyaluronic acid per day to improve the water supply in the cells. No more than five cups of coffee per day. No more than two cups at a time.

On 5 July 2015, some eight months later, we found the following situation: The patient and daughter came into the practice beaming. When questioned again, the daughter was forbidden to speak or react. This should prevent any help in answering the questions. The patient was forbidden even to look at the daughter, but only to concentrate on answering the questions independently. When asked if and how she had travelled, she replied: "That was an hour by plane yesterday." They had stayed in a hotel whose name she knew. She was able to give detailed reports on further questions about the day before, e.g. what she had eaten for supper. She also knew what she had had for breakfast that day. When asked how old she was now, she answered, after glancing at the ceiling for a moment, "76". It was right because she had had a birthday in the meantime. And so it continues.

The daughter and the family were overjoyed and showed it extensively after they were allowed to react. They confirmed a significant improvement compared to before. The last thing she was asked about was her life's work, and she answered, as was extensively confirmed by her family: That she does a lot of manual work. She should now pursue this hobby more intensively again. She could also get by on her own for most of the day. The family was told to "move on".

What happened, I asked myself, and at the time I interpreted it as follows: Apparently, the stimulation of the neurogenesis and synaptogenesis of the brain regions important for Alzheimer's disease by stimulating the corresponding "points" according to the rules of ABS according to Werth, In other words, the "Forever Needle Therapy" led to a regression of Alzheimer's disease. The combination with the other recommended measures supported the effect of what I call "Auricular Brain Stimulation" (ABS).

In my earlier medical history with the beginnings of therapy with the help of ear micro-implants, there were two or three other examples of early stages of Alzheimer's disease that showed improvement that I can remember. At that time I could hardly believe my senses when relatives reported enthusiastically about it. At that time I had not understood the meaning of these beautiful experiences as I do now. Now I am determined to continue on this beneficial path.

Case 2 - 84-year-old Heinz Engelking from northern Germany

The 84-year-old Heinz Engelking wrote a report entitled "How I came to Doctor Ulrich Werth and his "Forever Needles" (acupuncture)":

My wife fell ill with Parkinson's disease in 2010. Over the years, her health deteriorated to the point where I had to care for her, which took all my strength. The burden of day and night care, housework, etc., led to increasing exhaustion, even though my daughter was there to help me. In the clinics and nursing homes where my wife was admitted for her heart problems, osteoporosis and fractured femur neck, I was appalled to see how miserably the patients were cared for. For example, once no nurse came after my wife rang the bell. All this caused me worry, anger and rage and left its mark on me physically.

After she died in 2014, I also began to deteriorate. I developed restless legs, my writing deteriorated and I found it difficult to do maths. In 2016, I noticed that I was isolating myself socially. I avoided contact and conversation with people I knew for fear of stuttering in front of them because I could no longer form a complete sentence. I no longer felt safe walking and was always afraid of falling to the right. My memory was also getting worse. I could no longer remember the names of my former colleagues. It was terrible. In my mind, I saw my wife's cousin and my wife's brother, both of whom had dementia. I panicked that the same fate might befall me.

Hoping to find some help, I searched the internet and that's how I came across Doctor Werth and his Forever Needle Therapy. I grabbed the straw and immediately contacted Werth's practice. Everything went smoothly: Doctor Werth called me back personally and we made an appointment at short notice. My first impression was very positive. The friendly practice team took care of the accommodation and flight bookings. Together with my daughter, I was on the plane to Valencia, Spain, 3 weeks after the phone call. After the consultation on the first day, several needles were inserted into my ear on the second day. By the time I was finished and could leave the treatment room, everything had changed. I was immediately able to walk safely without feeling that twinge to the right. Since the treatment, things have taken a turn for the better. My vision has improved and my writing has become clearer. The trembling in my hands and feet has subsided and I can now see much better in the eye I had surgery on in 2011. Long-forgotten names came back to my mind. Three weeks after my treatment with Werth, I met him again in Leipzig and told him with gratitude: "It was all buried and is now slowly coming to the surface".

Yours sincerely
Heinz Engelking

His treatment took place on 13/02/2017. A year later, he gave an interview on Switzerland 5 in the programme "TimeToDo". He was completely lucid.

Case 3 - Some more information about Peter Kaess

Case 3 in chronological order has already been reported. You can see the eight-minute video recorded 24 hours after the treatment and the interview filmed a year later on the website and see the healing that took place in hours. Here is the link directly to his description 24 hours after the therapy and a second description a year later:

www.forever-needle.com/de/sensationelle-alzheimer-heilung.html

Peter Kaess, a 75-year-old patient with a marked cognitive deficit with pronounced disorientation, an MMSE score of 15 corresponding to moderate dementia, and pronounced atrophy of the temporal brain including the hippocampus, experienced complete remission within 24 hours of implantation of the titanium microimplants. One day after treatment, he quickly regained his orientation and scored 30 on the MMSE. That is the maximum. He no longer had any dementia.

Two months after the treatment, Peter Kaess wrote us his report entitled "I had Alzheimer's":

After a magnetic resonance imaging (MRI) scan in Switzerland in 2014, my family doctor confirmed that I had Alzheimer's. The result came as no surprise, as the signs had been increasing for several years. However, I soon had to abandon my plan to work in a home for disadvantaged young people in Mexico. During the first two years in our adopted country, my mental and physical condition deteriorated rapidly. I became a grumpy contemporary, uninterested in anything, useless and trapped in myself. I noticed that I was going downhill mainly because my Spanish and cooking skills were disappearing more and more every day.

But then came the day when everything was to change. My wife and I were watching a film on the internet about - what else - Alzheimer's disease. On YouTube, the Doctor Ulrich Werth was interviewed about his invention of the "Forever Needle" and his sensational success in treating Alzheimer's disease. Yes, on the one hand, I was very sceptical about the reported results, but on the other hand, I had nothing to lose - my wife said: I'll sign you up, I'll book us a flight to Valencia!

And the result, you ask? My answer - sensational! My wife and I could hardly believe it. Imagine, the evening after the "operation" I was a new person.

I knew exactly who and where I was. The frosted screen was gone and I could see the difference between before and after. In the "before" I just shrugged my shoulders and smiled embarrassedly when asked about the current date, day of the week, month or year. In the "after" I am present again and integrated in the now. I have an overview, of how I see myself and the situation. I know what I am doing, I decide for myself and articulate myself. I can concentrate again, which was impossible before, and I can read books again. Today - about two months later, back in Mexico - when we look back on the treatment with some distance, we are grateful every day that we made the trip to Valencia. We owe a great deal to Doctor Werth and his team. Hopes, predictions and promises have been fulfilled. Of course, as the saying goes, "good things come to those who wait", so we are overjoyed with the progress made so far and excited about what is yet to come.

17/09/2017, Peter Kaess

Case 4 - 48-year-old Mrs D. with a genetic predisposition

A 48-year-old patient, Mrs. D., came with her friend, with whom she shared an apartment. She had spent many years doing shift work in a preemie ward. Her heartbeat for the babies she looked after. But very often they didn't get through. For her, a loving woman, that was an endless emotional trauma. There had been cases of Alzheimer's in her family. It was a family with the Alzheimer's gene. In this early form, a greater susceptibility to developing chronic stress is to be expected. Mrs D. also reported that she immediately noticed everything better and made an extremely happy impression after the treatment. Eight weeks later, the friend reported: "Things could be better, by no means worse, but she wasn't as smart as she used to be in the household." Mrs D. sent me WhatsApp over the following weeks. She hadn't been able to do that before. According to the test, it was moderate dementia. After more months I kept receiving WhatsApp with pictures and texts from different countries in which she reported that she was fine, she was now travelling the world and that she was happy. I didn't get any more information. Perhaps she no longer wants to be reminded of the terrible disease.

Case 5 - 66-year-old Mr M. from Minsk with severe dementia

A patient from Minsk, Mr M. (66), came with his daughter. She lived in Germany and could translate well, so we were able to do the test with an interpreter. Before treatment: Severe dementia. MMSE 6 points, drawing a clock was completely impossible. Objects could not be named. After the treatment, he looked at a picture with great interest, enjoyed the colours

and recognised the rising sun, the trees and the mountains in the picture. The daughter was overjoyed: "He's interested in something again!" Seven days later, the test had risen to 9 something.

His wife reported a better ability to cope with everyday life. He remembered experiences from the previous day and sometimes from earlier. This was important for the couple because the shared life story connects and is the beauty of long-term relationships. More recent information from Minsk is still missing.

Case 6 - The 65-year-old patient with paraphasia (talking next to it)

Another 65-year-old patient, accompanied by his daughter, talked a lot, but not what belonged there. Psychiatrists say: Not appropriate to the situation, a paraphasia, i.e. talking inappropriately. It was also completely incoherent. The result of the test was medium dementia. He tried to cover up the dementia but was unsuccessful. The next day he scored 28 points as no longer demented. The before and after test was recorded on video. It is very long and so we only want to use it for scientific purposes, although it impressively proves the difference between before and after. Again it happened that the daughter was able to report in much more detail about his increase in cognitive functions. He was open-minded, interested and "clicked into the world", as Mrs Kaess had also explained. All the partners of the other patients also reported the same: The person concerned is "present" again.

Case 7 - 76-year-old Mrs H. with severe dementia fully capable of everyday life in three months

Mrs H. made an extremely nervous impression during the test. As bad as it turned out, it was moderate dementia. The day after the treatment she was remarkably calm and only showed mild dementia. Enthusiasm emerges from her husband's descriptions. She is calmer and old memories are slowly coming back. The perception was much better than before. There was also a significant improvement in the dementia test for her, Mrs H. (76). After three months, the husband reports that she is present again. This is shown by the fact that she cooks well and diligently, keeps the house in order and also keeps everything in the garden in good condition. He is very content and happy, but the earlier memories are only available now and then. He is still waiting for this three months after the treatment. The connection between "here and now" and the past is still a long time coming.

To assess the long-term effect, I called her a year later. I asked how she is now. "The neurologist tested me and, contrary to expectations, found 6 points more in the MMSE. He said that he wanted to get me a care allowance. But with this test result, that's not possible." She said to him, "What makes you think of that? I'm never in need of nursing care." The husband confirmed this after she handed him the telephone receiver. The neurologist was keen to prescribe another drug. The H. family laughed at the neurologist.

Case 8 - The only patient who failed and the reason for it

One day the daughter of a dementia patient called me: "My mom has dementia. My sister is already taking care of her." This daughter impressed me, she had her heart on her hand. You could hear the absolute honesty and boundless love for her mother. But Mama no longer knew where she was, no longer where the wastepaper bin was, no longer what year it was. She remembered her first name and recognised her daughter. In the MRI, I saw with horror: "Microangiopathy with encephalomalacia foci", i.e. vascular dementia. "Oh dear," I said, "that could be an obstacle to therapy." But since the micro-implants can't do any harm, we didn't want to leave it untried. My saying from the song by the group Queen is forever: "We are the champions, my friends, and we'll keep on fighting till the end". The end can only be death or the patient's will to give up. I'll stay in touch with all "Forever Needle Friends" to the end, or of course much better in the normal windfall of recovery. We'll all be friends until the end. It's called "aftercare".

Hope flared for a moment. Mom was looking for the wastepaper bin to throw some rubbish away. That was just immediately after the needles. Then dark night came again. In the months that followed, memory, orientation, and situational awareness faded, as is common with dementia. I stayed in touch with the family. Mom had to go to a nursing home. It did not help. Endless sorrow and tears. It had been such a lovely woman. I visited her in the nursing home. The material equipment was nice. There was also a great colleague who took the view: "We don't sedate the patients more than necessary. We want to give them a decent existence for as long as possible. But the staff changed often. The vital human connections that

can protect us all from Alzheimer's were constantly being severed. After a few months, on October 30, 2017, mom no longer recognised her daughter. Fiddled and fidgeted without any purpose. Suffering without end.

It was God's message to me. It is:

**Do everything in your power
to prevent such suffering!**

Case 9 - The 84-year-old patient with extremely advanced stage Alzheimer's dementia with a detailed report of his daughter

The patient's daughter wrote to us: My father, 84 years old, started developing Alzheimer's disease about nine years ago. Despite the usual medication in the form of patches, he has reached the stage of severe dementia. He is in excellent physical and sensory health. He is mentally absent, his eyes are staring into space, his orientation is limited to the well-known beaten paths, and his long-term memory, from which ancient stories have been bubbling out for a while, has also let him down in the last year. Short-term memory is now almost non-existent. When he wants to say something, he has trouble articulating it. Mentally he gets everything, but even if he tries, he no longer has the opportunity to express himself verbally because he lacks the words. He is fully aware of this and the powerlessness he feels depresses him deeply. The active lively, creative and very talkative man with an immense amount of available knowledge has become a very quiet and introverted person who hardly speaks and seems to have no motivation anymore. Despite all this, he has a very good emotional relationship and access to his surroundings, especially to those close to him.

Over a year ago I saw an interview on YouTube with Doctor Ulrich Werth. I saw his treatment method with the "Forever Needle" and found it interesting and wanted to take a closer look at it. I didn't do this until January 2018. After a short family council because Papa had nothing left to lose, a few days later we met Doctor Werth and made an appointment for February 22nd in Valencia, to which my mother and I accompanied Papa.

Doctor Werth has confirmed the severity of the dementia and suggested increasing the number of needles normally used. He informed us that Papa is his patient with the highest level of dementia and said that spontaneous recovery was out of the question and that it would take months for him to regain his memory. We agreed: Better later than never! Doctor Werth has informed us about another possible support, that of the healer Stefanos Iakovidis, with whom he has had very positive results in other treatments. Since we are open to alternative healing methods, we have agreed that Stefanos will contribute to the resolution of dementia with his healing energy.

Doctor Werth planted a total of 139 needles in both of Papa's ears. When he came out of the treatment room with him 20 minutes later, I was a bit irritated because Dad's look had changed. He was more alert and penetrating. Mother voiced my observation. Doctor Werth explained to us that this is a one-second phenomenon. In the consulting room, Werth asked Papa simple questions about the person, which he could only partly answer. Werth then showed him two pictures on the wall, which he was asked to describe. After a moment's thought, he did so and not only described the objects but also named the colours. He gradually made contact with his environment.

This observation was confirmed during the day and the next day. In the dementia test, which he took 24 hours after the treatment, the number of points increased from just under 6 points to 10 points. He was now able to draw a clock with one hand.

Mother and I scrutinised my Papa's every move. Every hour there was a new development. In summary, changes in the following areas can be described:

Memory and recall ability:

It is with great joy that we note that the emptiness that dementia has created in Papa's brain is receding. His cognitive and motor skills and sense of direction are gradually returning. He is again able and willing to reflect, to communicate with his environment and to communicate his needs. The progress can be seen daily.

Perception and orientation:

Papa started to take an interest in the world around him just a few hours after the treatment. His gaze moved in all directions, reminding me of a hound picking up the scent. When I kept asking him if he knew where we were, he said no several times, but in between he said, quite surprised, that couldn't be because he couldn't remember how we got to Spain. He began to reflect on what he was hearing. On the third and fourth day, he was no longer disoriented after waking up, but he can now articulate that he wants to get up to go to the bathroom. At the breakfast table on the second day, he saw a very tall woman in front of him and at the same time shared his astonishment with me. We walked a path and returned via the parallel path. The old path was visible, it suggested that we go back the way we walked before. Memory and orientation announce themselves!

In the last few months, he no longer knew what to do with the toothbrush. On the second evening, he put his toothbrush in the toothcup himself. He can focus on something again and coordinate movement sequences.

And the absolute hammer: In the hotel's bathroom there was a telephone that was screwed to the wall. The cord was twisted, he sees it, perceives it, picks up the receiver, straightens the cord and puts the receiver back into the shell! The old sense of order says hello again...

Expression of will, desire and feelings:

Papa gives the impression that with the awakening of perception, his ability to express will and desires is also returning. On the second day, he explained to us that he didn't want to walk on the beach because he didn't want to get his shoes full of sand. It reacts to cold and heat and expresses needs such as drinking or sleeping. Today he announced to my mother that he was bored. She provided him with work in the kitchen and he did everything right.

Language:

After the treatment, while walking in the old town of Valencia, he looked at a tall building and, of his own accord, expressed in a complete, correct sentence that he found it beautiful. The pronunciation was clear and the voice firm. After two days he speaks of his own accord in complete, syntactically well-formed sentences and uses the parts of speech correctly. This is not continuous, he is often looking for the right word, which he tries to reproduce with incomprehensible and unclear sounds. He takes the initiative to find the right word. Again and again we show him objects that he should name. He can't think of nouns yet, he describes the objects. Retrieving a term or a word does not work yet. But if he was told an object within a minute or two and he didn't fetch it, he could name it again later (tomato, pear, plate).

Mom asked him something in French on the street and he answered her in French. Switching from German to Greek and vice versa works without any problems. We haven't tried English yet. But it shouldn't be a problem either, especially since he has always read and pronounced Spanish words correctly of his own accord (basic knowledge is available). The translation of a word from one language into another does not work yet because he cannot remember the terms.

Numbers:

We let Papa do the math. He counted from 1 to 50 fluently and flawlessly. Adding small numbers worked very well right away. Then with higher numbers. Subtracting wasn't immediately available either. But he could do that again soon. After a while, we repeated both and adding was still present. Then we multiplied. Low numbers weren't difficult, with higher numbers he managed throughout the day, he was able to pull off the 1×1 . He has trouble dividing. He can't do that yet.

Colors:

He was able to name the primary colours blue, green, red, white and black straight away. Orange, yellow and bordeaux red are not present to him.

In just under seven days, I noticed that the abilities that are acquired anthropologically first and forgotten last are also the first to return. The low numbers can be accessed first because they were acquired first, addition is present before subtraction, and at the very last (hopefully!) division will be available again. The primary colours can already be called up, the secondary colours will probably be able to be named again later. It can be assumed that, analogously, the naming of objects will first be cognitively present again and later that of abstract concepts.

The short-term memory that Papa lost the last time gradually returns first, while very old memories reappear from the long-term memory. The sense of time is not there yet. In summary, I can say that in the week since the treatment, Papa has made great progress. He surprises us every day with a new behaviour, a new achievement that we thought was lost forever. Seven days after the treatment we are still at the beginning of what will hopefully not be a long journey. We hope that in the end forgetting will only be present as a memory.

With the treatment of dementia, Werth's Forever Needle not only opens up new avenues and possibilities for cognition and memory research, among other things, but the most important thing is that it is an instrument to give people back their memory and thus their identity. It opens up the possibility of leading a self-determined life again. And it is to be hoped, also a life in full consciousness. In any case, we as a family are Doctor Werth eternally grateful that Papa's treatment with the Forever Needle opened the door to his new-old world. Even if it should remain just a crack, his quality of life will be immeasurably better than in the darkness of oblivion.

Munich, March 1st, 2018

Dr. A.G.

PS Papa called me today and asked when I was coming home..."

Case 10 - A case of incipient dementia - A patient who would have lost her livelihood

One day she contacted me, Helga M. She had a shop selling food supplements and lots of healthy things. Helga came from Austria. She told me that due to her failing memory, she would probably soon turn her shop into a huge mess and her livelihood was in jeopardy. She tried to numb her dissatisfaction with sweets. Helga got the needles from me and after a short time reported a clear improvement in memory and her aversion to sweets. She was able to get her shop completely back in order and everything ran like clockwork for her again. She proudly reported this success story on the Switzerland 5 channel.

Case 11 - Healing in seconds of a Turk with pronounced Alzheimer's dementia

A Turkish citizen with extremely pronounced Alzheimer's syndrome was registered with me. Shortly beforehand, my partner showed me the MRT image on the computer. I looked at this very carefully and was very pleased to find that he had only temporal brain atrophy with very pronounced hippocampal atrophy. Based on the experience I have had with Alzheimer's patients, this was an extremely promising patient. No additional damage to the brain could therefore be identified from the MRI. So that means no consequences of a stroke, no encephalomalacia, no circulatory disorders and no other types of damage.

In practice, I initially had to treat another patient. When I came out of the treatment room, I saw an excited and scowling Turkish family sitting. It was the patient's wife, there were two older sons, and the patient himself. First, I asked the family who lived in Germany why they all looked

so scowled and tense. The son, who spoke better German, said: "We all believe in your therapy and think that it could save our family. The only reason we're concerned is that we don't know if our father will have the treatment as he hasn't spoken a word in months and we'll be lucky if he follows your advice on the treatment."

The patient's name was Veli B. and he was 77 years old. I had the family tell me the whole story and heard that it had been a long time since he had recognised his family members. He hadn't spoken a single word in the past few months. This information does not cloud my optimism, as I have seen in other patients with severe temporal lobe and hippocampal atrophy that Alzheimer's need not be a problem when the needles are inserted. I drew my pin map onto the pre-printed ears, paying particular attention to the corresponding points of the hippocampus, temporal brain, limbic system, and especially the corresponding points of the sensory and motor language regions of the cerebral cortex. It is what doctors call Wernicke's language centre on the temporal brain and the motor language centre, the so-called Broca's language centre. The latter is located in the lower part of the motor cerebral cortex of the frontal lobe.

When the needle plan was ready, we brought the patient into the treatment room on the couch and after the preparations, I started with the right side, the right ear, to implant the tiny titanium points into the painted points and small areas under the auricle skin.

Already treating on the right side, I heard the patient begin to speak in Turkish. The family was overjoyed. The son was now able to talk to him sparsely at first. When I was at the left ear, the son said: "Now he recognises me again!" In this situation, he spoke the first few words in German. After all the needles were implanted, we disinfected again and sprayed the auricles with plaster spray. So the auricles had an adequate wound dressing.

We asked the patient to stand up and told him he was done. Now he began to participate in the conversation. So we talked for quite a while. The patient thanked his wife with a hand kiss. He also politely thanked me, as if he had never had Alzheimer's. We were very happy with the family and peacefully said goodbye. The family had to go out in the rain. The patient's wife took our umbrella. The patient then said: "But that's not our umbrella." That was correct. It was amazing for all of us that within seconds or minutes, the patient was mentally fully there and completely oriented to the situation.

The situation with the need for explanation:

When I got home with my partner, the biggest problem for us was explaining this rapid change in the patient. I had done research in neurobiology for a long time, but I could no longer justify what I had just experienced with neurobiology alone.

I didn't have to consider the fact that the shrunken or medically atrophied brain was no longer a problem for me. We had thought long enough about this with the patient Peter Kaess. The function is the primary and can also be realised by a smaller brain. Of course, I knew that the next day could not give a larger brain again, because all biological processes have certain time parameters. It was clear to me that it would naturally grow again in

the future, i.e. that the hippocampus would increase in volume. I knew the shrunken brain had to be the result of not using it. First, it was not needed and then atrophied. Now that it is used and needed again, the process would be reversed. So if there is no material equivalent and cannot exist for the patient to start speaking again during the treatment, a completely different explanation had to be used.

Case 12 - Healing within seconds of the painter Mr S.

Mr S. had extremely advanced dementia of the Alzheimer's type. A camera team was present and either didn't care or didn't understand that I was doing the MMSE with him in front of the camera. He could only respond by shaking his head or nodding, and his maximum score of 30 points was 0 points. His wife, family, and he, as far as he could tell, agreed that we would do the Forever Needle treatment for dementia on him. I suspected that the cause of his dementia because he was a painter and painters work with turpentine and other toxic substances, was that his dementia was toxic. Surprisingly, the Forever Needle often help, regardless of the cause. When we laid Mr S. on the couch and implanted the first needles, he seemed to wake up from his dementia sleep, because he suddenly asked excitedly: "What are you doing with me?" We called his wife and she explained to him again, what was being done to him at the moment and explained to him that it was necessary. Then Mr S. gave his consent. His wife was frantic and excited and said with tears of joy in her eyes: "This is the first time in a long time that he understands and listens to me. Obviously, the first needles have already taken effect."

The next day we wanted to check how he was doing and whether the tiny holes in his ears had healed without causing any irritation. The TV presenter Norbert Brakenwagen wanted to film an interview with him right away. He and his wife agreed. Mr S., the painter, was talking like he used to, had fully grasped the situation, and his wife was crying with joy. Unfortunately, the family still did not agree to broadcast the sensational film. Over time, I lost contact with the wife and the patient. Sadly, I do not know if it was permanent, as I learned from Peter Kaess' second interview a year later. Nevertheless, for me, it was further proof that healing within seconds with the Forever Needles is often possible in Alzheimer's.

Case 13 - A case of frontotemporal dementia

Kerstin and Jürgen had heard about me and wanted the Forever Needle Therapy. Jürgen said it was so bad with her dementia symptoms that he saw the Forever Needle as the last chance not to have to take Kerstin to the nursing home. In frontotemporal dementia, the motor cerebral cortex is no longer fully functional. MRI also showed a clear enlargement of the outer cerebrospinal fluid space and thus an atrophy of the frontal cerebral cortex. With Kerstin, it is so noticeable that she could not complete any action and could not speak a complete sentence. It was now so bad that there was hardly any communication between Jürgen and Kerstin. Both were deeply unhappy. Just one day after implanting the Forever Needles in the appropriate points of the auricle, one could see a significant improvement in sentence formation and the execution of actions, which were again goal-oriented. Both were overjoyed and left the practice hand in hand.

Now they were looking forward to enjoying life again and to touring Europe on their motorbike. When we called them, they were on a trip to Italy. They could not have imagined such happiness before the treatment.

You can read Jürgen's report nine months after the treatment here:

"In June 2022 we visited Ulli and Iris in Mallorca to heal my wife Kerstin with the Forever Needle. Three months earlier we had been diagnosed with dementia by a neurologist in Saarbrücken. The diagnosis was made without emotion, there was medication and that was it. But I had seen Norbert's videos three years before and knew that there was someone who could help us, so I started. Two days later I had an appointment with Iris, Kerstin and I started full of hope and confidence.

Six months earlier I had noticed the gradual changes in Kerstin, the language changed, Corona appeared and Kerstin withdrew. The change took its course and I saw the rapid deterioration and the centre of attention coming closer and closer. Kerstin was a civil servant at DB-AG and shortly afterwards she took early retirement with this diagnosis.

We arrived in Mallorca, Kerstin was completely disoriented, the flight was difficult for her and she couldn't make it alone. But she had hope and faith. Today is March 2023, nine months after the start of the Forever Needles. No sooner had the needles been placed than Kerstin felt the first improvements, she spoke of it as if a bubble had burst. Kerstin is back in life. Today she leads a normal life. She is not forgetful. She enjoys life again, on a scale of 0 to 100 we have reached 80 and the development continues.

What remains: She has a word-finding disorder, which many people have when they are tired, for example. Before the treatment with Ulli's Forever Needles Kerstin could only speak in a telegraphic style and most of the time communication was hardly possible. She's still a little anxious sometimes and doesn't trust herself as much as she used to. She used to go to the sauna once a week. As things are getting better, we hope that she will soon be back to her old self.

Dear Ulli, thank you so much for staying true to your medical oath and being able to heal people. Kerstin got a new life from your hands.

Many thanks
Jürgen and Kerstin"

What happened next?

Total success after the second session:

Five days after the second session, Jürgen wrote: "Today Kerstin suddenly started to speak again without any mistakes." So the treatment was very successful.

My career in medicine

Successful PhD with the founder of neurobiology

After completing my medical studies at the University of Rostock a year earlier with a grade of "very good", I started as a research student in pharmacology at the then Medical Academy in Magdeburg. The head of the institute, Hansjürgen Matthies, went down in medical history as the founder of neurobiology. The knowledge I gained in pharmacology, for example about the mechanisms of action of drugs, serves me to help patients today. The experiments I carried out for my diploma and doctoral theses to better understand the mechanisms in the brain were an important prerequisite for curing Alzheimer's later on, i.e. today, and for understanding the mechanisms.

After I had completed this thesis, which is still relevant today, the head of medicine and brain research in the GDR, Hansjürgen Matthies, wanted to keep me at his institute. I was only able to escape from this world-famous institute using a tricky escape. My most urgent wish was to use my knowledge and understanding of how the brain works to benefit patients. I refused all of Professor Matthies' career promises. I only managed to escape by persuading the director of the psychiatric hospital next door, who was a week away from retirement, to sign off on my employment as a registrar in training to become a specialist in neurology and psychiatry. Because this professor didn't care about the influential Prof. Matthies either, one week before his retirement.

After the fall of the Berlin Wall: Recognition as a specialist in neurology and psychiatry

On my way to becoming a specialist in neurology and psychiatry, which I had hoped to achieve by taking the examination, I encountered several obstacles. The black hand in the background, the "Stasi", prevented this for 15 years, until shortly before the fall of the Berlin Wall. I had used this rocky road to gain as much experience, knowledge, skills and expertise in medicine as possible. I responded to every obstacle to being admitted to the examination by saying that I would need a secondment to another clinic to supplement my apparently inadequate knowledge. In the end, I had the pleasure of working for half a year at the flagship hospital of the GDR (German Democratic Republic), the Charité in Berlin. In the end, I had made a virtue of necessity. During the specialist examination, I once again brought the professors on the examination board up to date with the latest medical knowledge in the fields of neurology, psychiatry and paediatric neuropsychiatry. They didn't have as much of a clue as I did, because in their heads was written the sentence: "The Party is always right". I did not have this mental block. Therefore, as a free thinker, I was able to understand much more.

The day after my specialist exam, my worst enemy, Prof. D. K., could not stop talking about how much knowledge I had. It was the talk of the university. The professors met me and congratulated me and told me how my enemy had reacted. Later, after the fall of communism, I found out the reason why I had been prevented for so long from taking the final exams for my specialist training and further education. It was written in my Stasi file: "Ulrich Werth is lecturing the party and is therefore to be excluded from a career...".

Discovery of acupuncture as an alternative to medically prescribed drug abuse

After the fall of the Berlin Wall, I set up my practice as a neurologist in Magdeburg. Even before becoming a specialist, I had seen many patients who were victims of drug abuse and its consequences. I published an article on iatrogenic drug abuse, i.e. abuse caused by doctors, in the most prestigious GDR journal, "Medizin Aktuell". It was during this time that I realised that drug therapy, which is so harmful in the long run, had to be replaced by something else, something natural. Even before the fall of the Berlin Wall, I heard about Gerhard Matte MD, a doctor in Biederitz, who used acupuncture very successfully. I followed this up, visited him, sent him patients and examined them before and after acupuncture. It did not take long for the acupuncture fire to take hold of me. It was clear to me that I would fly to Beijing as soon as possible to attend the acupuncture school. With acupuncture, now I have a much better, side-effect free and healthier remedy for many ailments at my fingertips. Perhaps that is why, as I read in the secret file of the Halle State Examination Office, I am on the warning list for doctors'. No one from that office can or is allowed to tell me what that means. I have no criminal record in any country, and I have never been accused of doing anything illegal in Spain.

I am sure that in today's world, the abuse of drugs prescribed by doctors has taken on much greater proportions. But today you can't publish such strong criticism because the journals don't want to take on the pharmaceutical industry.

I could see over and over again how acupuncture had incredible and unimaginable positive effects on people's health. That is why I wholeheartedly embraced this form of therapy. My only ambition was to help and heal. Soon I was called the "needle piercer" of Magdeburg and today, after 15 years of not working in Germany, I am still legendary and talked about.

In my book "Parkinson's loses its terror", which is also available from us, you can read more about my acupuncture successes and my path to the Forever Needle Therapy. In this book, many questions are answered that are also relevant to other diseases. To better understand the treatment method with the Forever Needles, I can only recommend that you get this book from us as well.

Discovery of the Forever Needle Therapy

“Chance” helped

Over time, I got better and better at hitting the right points with ordinary acupuncture needles. A list of success stories can also be found in my book “Parkinson’s loses its terror”. It contains old and new success stories written originally. No wonder I became the legendary acupuncturist in Magdeburg who is still talked about today. Our practice had to move several times because there was not enough room for all the acupuncture patients. One day I remember going through the list. There were over 100 patients I had acupunctured that day. In the evening I was completely dizzy. I couldn’t go on like this, even though I enjoyed the work because I was relieving people’s pain. I began to think about what I could do next.

Usually, patients had to come at least 10 times for acupuncture to get rid of an illness like migraine. I was looking for a solution so that patients would not have to come so often, or even just once.

One day, a patient with trigeminal neuralgia (facial nerve inflammation) had an ASP needle inserted under the auricle at the important point at the back of the earlobe, without me noticing. ASP needles are very small, have a small head and remain in the ear for about five days. The patient, who had wanted to commit suicide because of the unbearable pain, came back after three weeks with a bouquet and said: “I am cured”.

ASP- Needle with head

For me, this sudden healing was a challenge to solve the mystery. I felt the ear and found that the small ASP needle had grown under the skin of the ear. After a while, I realised that the ingrown needle was the key to my problem of achieving more with less.

Then one day, when my bank manager's father came into the practice with very bad knee pain and walking problems, he said: "Do what you want to me, but get me out of this pain". This time I deliberately placed the ASP needles, which were not yet suitable for this purpose, in the knee points. The patient felt immediate relief. After three weeks, he came into the practice without a cane and pain and danced with joy. But I always say: The gentleman enjoys and remains silent. Mr K. could not keep his enthusiasm and joy to himself. As the saying goes, exuberance is rarely good for you. In the evening he called to say that he had fallen on his knee. The next day he went for an X-ray. Nothing was broken. It was just a bruise, but the remarkable thing was that he told me that the orthopaedist was very surprised that he had more cartilage than before.

World Acupuncture Congress 2001

At that time I thought that the main indication, i.e. the use of implanted acupuncture needles, was for the joints. I soon received a call from the Acupuncture World Congress, which was held on 17 June 2001. Wander MD, the organiser, invited me to give a talk on the subject. By this time I had successfully treated several patients with joint problems. I would like to say in advance that after several years I asked these patients again how they were doing. All I heard were encouraging responses.

Before my small pilot study for the presentation at the World Acupuncture Congress was completed, a Parkinson's patient introduced himself and asked me to try my method on the ear acupuncture points corresponding to Parkinson's. It was amazing how he came back six weeks later with half the Parkinson's medication and waving his arms to tell me about his success.

Parkinson's becomes curable

From that moment on, Parkinson's became the main indication for my Forever Needle Therapy. Mini-needles made from pure titanium were manufactured in accordance with the Medical Devices Act. They are very handy for implantation and have no head to prevent them from slipping under the skin.

To give you an idea of how tiny the titanium tips that have now been used for many years are, take a look at the picture! All possible complications such as migration, overstimulation, etc. have been ruled out in years of testing.

*Highly magnified Forever Needle (0.6 x 1.2 mm)
with implantator*

For years, all I heard from patients who travelled from all over the world for the "once-in-a-lifetime acupuncture" was that they felt a thousand times better in every way with these imperceptible, invisible, yet effective mini-needles. My conclusion: More energy makes you fitter.

Discovery of the Alzheimer's cure

The discovery in Colombia

In 2014 I went on a lecture tour to Bogota, Colombia. I met the first woman with Alzheimer's disease, whose daughter expressed the wish to use the Forever Needle to free her mother from Alzheimer's disease. The Alzheimer's patient, Graziella Forera, was 75 years old and only responded to her name, but otherwise couldn't communicate with anyone or even complete an Alzheimer's test. The magnetic resonance tomogram, i.e. the MRI, showed a shrinkage of the temporal lobe of the brain including the hippocampus.

I don't know why I was so hesitant and sceptical. But today I think a lot of nonsense is being suggested to us with the help of the mainstream media. And this nonsense is repeated over and over again until you finally believe it. At that time I had the sentence engraved in my brain: Alzheimer's is a terrible disease, it progresses and the patients can only expect the nursing home and an agonizing, terrible death. Alzheimer's is incurable. The pharmaceutical industry had already spent 100 billion euros on research but found nothing effective.

At the request of the daughter, I carried out the treatment. The patient's daughter rightly said: "If you can use it to cure Parkinson's, which is a neurodegenerative disease, it must also be possible to cure Alzheimer's."

I briefly thought about which brain regions are particularly important for memory and implanted about 50 mini-titanium needles on the right and 50 on the left at the corresponding points of the auricle, corresponding to the upside-down homunculus. So for each cerebral hemisphere 50 in the patient.

Inwardly, the patient didn't move me any further at the time, because I knew that even if I was successful, nobody would believe me. After all, Alzheimer's is considered incurable.

After eight months, I received another invitation to Bogota to give lectures and treat patients. Graziella also came with her daughter. Surprisingly, we were able to have a wonderful conversation. Graziella told me that she flew an extra hour by plane to another location in Colombia to give me the good news of her healing. She told me exactly what she had eaten for breakfast, in which hotel they were staying and also that it was her birthday and she was 76 years old. The family was overjoyed. The daughter and Graziella hugged me and thanked me very much. The daughter also reported that she was now pursuing her hobbies such as needlework again, kept her household in order all by herself and was back to her old self. Graziella confirmed this and took part in the conversation entirely appropriate for the situation as if she had never had Alzheimer's or any other memory impairment.

Even so, I knew that while it was very nice, it wouldn't have any impact because the people it affects are completely brainwashed by the media, which is paid for by the pharmaceutical industry.

My first self-treatment

For myself, the inventor of the Forever Needle Therapy, there was a consequence of this successful cure for Alzheimer's. For 14 years I have heard that people felt much better when they wore the Forever Needles in their ears. I knew that these invisible and imperceptible mini-titanium needles implanted forever under the skin of the ear would bring nothing but benefits to the wearer. I also knew that these needles only work when the body needs them. So my conclusion was: For the first time I will implant these mini-titanium needles in the same places as in Graziela. Although my memory was very good, I was so put off by the impression of the Alzheimer's patients from before that I implanted the needles myself as a precautionary measure.

To get feedback about me, I asked my colleagues and employees whether they had noticed a change in me: "Yes, you have become calmer and more balanced." That was an answer that I could use, because stress plays a role in the development of Alzheimer's, among other things. Perhaps the most common stress is self-inflicted stress. So for the first time, I placed a total of 100 mini-titanium implants myself. From that moment on, I had overcome the threshold to treat myself with the needles and have since treated all sorts of illnesses such as vertigo attacks, incipient Parkinson's disease and others and I feel very good about it. Of course, there are also anti-ageing points. Maybe it's not just the sport I do every day, the dietary supplements and vitamins I take, the meaningful life purpose and love, but also the Forever Needles that make me much younger, my skin smoother and many things much better.

Knowing that it isn't that easy to buck the tide of mainstream media and brainwash TV viewers, I set out to do a study as soon as possible. All efforts to carry out such a study in Germany were in vain. But not for nothing, because I now know what is played in this system: That it is not about health, but only about profit and you will even stop at nothing for that. Society is so sick that it is hardly possible to help people.

In the meantime, I have distanced myself somewhat from the efforts to do studies, because I hear from real scientists again and again: "We believe that. The video with Peter Kaess and his wife also convinced us that you can cure Alzheimer's with your method. But we can not officially appear for it. You can indeed cure Alzheimer's, but it is just not wanted."

From now on, I only see the possibility of collecting as many case studies and as many before and after videos as possible to help some people who have woken up. Those who have woken up are, of course, primarily the loving relatives. I have written down some of these case studies and will now publish them here. But in the meantime, many more patients "tried" it and didn't believe it before and are totally amazed or even shocked at the success afterwards.

Assessment of those who have woken up

A viewer of my YouTube videos wrote on the internet:

“Doctor Ulrich Werth is more than a doctor because this designation does not reflect his achievements and it is touching to experience so many fates. Even he, as a doctor, was able to treat Parkinson’s himself and has been giving back the joy of life to many people for decades. People with dementia, Alzheimer’s or Parkinson’s are fully aware of their limitations and are no longer able to communicate, or their movements are restricted while they are fully conscious. Thank you for your tireless work. I wish you good health so that you can bring back many more people (trapped in their bodies). Greetings from North Rhine-Westphalia, a Thuringian.”

Some colleagues have woken up:

Comment from colleague Andreas R.: “Dear colleague Ulrich Werth, my respect for your life’s work. Western conventional medicine is not good if it allows itself to be misused as a catalyst for state violence (keyword compulsory vaccination, profiteering (Bill Gates and WHO) and turns a blind eye to innovative or alternative methods. You set an example, unshakable and exemplary. My respect and thanks for that.”

On the trail of short-term memory

Connections between memory and brain function from the point of view of Nikola Tesla

If we look closely, there are electromagnetic waves everywhere, such as visible light. Visible light consists only of a frequency range from 400 to 700 nanometers. Other wavelengths are in the dark for us. Our perception is very patchy.

Wherever currents flow, electromagnetic waves arise and where electromagnetic waves meet electrically conductive material, currents arise again. Because energy doesn't disappear.

So the nerve cell emits electromagnetic waves into the universe with every action potential and it also receives electromagnetic waves because it has conductivity in the form of charge transfers. The constant interaction of charge shifts and electromagnetic waves is normal.

Nicola Tesla, the real inventor of the lightbulb, discovered what is called "free energy". It consists of the electromagnetic waves coming from the universe. The free energy that some technical scientists are concerned with today is not just energy per se. It also contains information contained in various parameters such as flow rate, frequency, etc. This has since been proven by James Oschman and others. This is why Tesla said and wrote:

"My brain is just a receiver of information."

The transmitter, he wrote, is hidden in the universe. That means we can't see it. He just hasn't found him yet.

The interaction between the brain and the universe

The communication of the 100 billion nerve cells in the brain via 100 to 100,000 synaptic connections from each nerve cell to others represents a kind of analogue universe. This universe is in constant change through use or non-use via circling excitations and interrelationships of excitations and inhibitions. Use paves the way through this unimaginable web of connections. Disuse causes the paths to atrophy and regress. The human brain, especially with its largest part, the neocortex, is the materially tangible or, in energy medicine terms, the "solid part" for the realization of memory functions.

The brain interacts with the "subtle part". This part consists only of lines of force of electric and magnetic fields and electromagnetic waves arising therein and possibly also individual elementary particles. This is the other part of the realization of the memory functions. The British biologist Rupert Sheldrake calls this part the "morphic field". He postulates that this "structure-forming field" influences all earthly processes.

This idea corresponds to our hypothesis of the interaction between the brain and the universe.

For a better idea of this interaction:

New experiences via the sense organs reach the brain as streams of excitement in the form of action potentials. They not only change the connection between the nerve cells through the use and non-use of the synapses but are also accompanied by the emission of electromagnetic waves resulting from the currents occurring in the nerve cells involved. These get into the universe to the morphic field.

There are also repercussions from the morphic field. Incoming electromagnetic waves in turn influence the charge shifts on the nerve cells. As a result, energy and thus information from the morphic field influence our nerve cell activity and therefore our intuition, our thinking and our behaviour. Especially the intuition. This type of inspiration can be recognised by the fact that it has not been triggered by any association beforehand.

So there is an interaction between the brain and the morphic field. Both are the sender and receiver at the same time.

Complex memory processes cannot only be explained materialistically

For my diploma and doctoral thesis, which I successfully defended in 1974 and 1975, I examined the influence of transmitters, i.e. carrier substances such as glutamic acid, on the formation of conditional connections in the brain (learning processes). Glutamic acid accelerated the formation of the conditional connection in the brain the most, i.e. these processes, which are adequate for learning processes, became stronger and faster with glutamic acid.

In the graph, you can see how clearly the formation of the conditioned response to the conditioned acoustic stimulus is under the influence of glutamic acid after 200 stimulus combinations. Such a thing was only possible under the influence of glutamic acid. The formation of conditional links or new ways of propagating the excitation was previously regarded as the sole basis of learning processes.

The figure shows the original primary data obtained for my dissertation. Comparing "a" to "d" shows an increase in action potentials immediately after the conditioned stimulus has occurred (vertical line). It was a sequence of 200 combinations with unconditional appeal. The increase in action potentials observed at d after the vertical line (time of stimulus application) is expressed by the height of the mini-columns. This means that the synapses of the feeding neurons became more permeable.

However, as we have deduced above, these processes are only one side of the memory function. The interaction with the morphic field makes the overall function possible.

Although the conditional link shown in the figure above was set up in 13.33 minutes, it was formed particularly quickly because glutamic acid accelerates the processes.

In patients with Alzheimer's, however, a recovery of much more complex memory processes such as the ability to speak, and the ability to reflect on the entire situation occurred just seconds after the treatment was started. We were able to observe this in a Turkish patient immediately after the needle implantation at the corresponding point of the language centre and in a German painter, Mr S.

So complex functions of the cerebral cortex come back to some patients after seconds rather than minutes after the Forever Needle Treatment. This shows that these previous, one-sided mechanical-materialistic explanations are not satisfactory. Additional processes at another level, which we call the morphic field, must be called upon for a sufficient explanation.

The influence of medicines on brain functions

On the materialistic or solid level, learning and retention are possible mainly and possibly only under the influence of glutamic acid. The glutamic acid engraves the information in our brains.

The medicine "Memantin", an antagonist, is pharmacologically an opponent of glutamate. The same applies to the drug "Amantadin", which is prescribed for Parkinson's disease.

Pharmacological research justifies the administration of the antagonist of glutamate, "Memantin", with the fact that too much glutamic acid is released in Alzheimer's patients and the nerve cells are overexcited. In my opinion, this is only the case in the early stages. Therefore, it would be much easier to remedy the situation, namely with high-dose vitamin B6. Why? Vitamin B6 activates glutamate decarboxylase.

A bio-enzyme that promotes the conversion of the stimulating glutamate into the inhibitory gamma-aminobutyric acid. Then the balance of both transmitters would be established naturally by the body. Sleep would also be better because it would be promoted by the inhibitory gamma amino butyric acid.

The glutamate antagonist "Memantin", which is prescribed as a conventional medicine for Alzheimer's patients, causes a reduction in information storage in many cases. This is also in line with our experience with patients. They report that after stopping "Memantin", forgetfulness is reduced. With the administration of acetylcholine esterase inhibitors, there were rather small positive effects. This corresponds to the slight improvement in the formation of conditional connections in the brain, as my diploma thesis from 1974 showed.

The memory could not be located

Additional proof that the brain cannot realise the functions of memory on its own comes as follows:

The localisation attempts of the stored information in the animal brain by removing slices of brain tissue by my brain research colleagues did not result in a localisation. This fact also made me very suspicious of materialistic thinking. What was being said couldn't be everything.

The mode of action of the Forever Needle Therapy

Yes, it was confirmed by the Alzheimer's patients with the super-fast healing, i.e. "clicking" back into the world, that this must be true. The formation of the conditional links that I described in my diploma and doctoral thesis takes far too long. It's usually 15 minutes. This does not adequately

explain the immediate healing of Alzheimer's disease. First of all, the immediate restoration of all the complexity of memory. According to pure materialistic theory, many billions of connections could never be created in seconds. They must still be present and only activated by the Forever Needle Therapy by reconnecting to the morphic field.

If what I was investigating at the time was to be ultra-short-term memory, as it was then said, the Alzheimer's cure with the Forever Needle, which occurred while the titanium tips were still pricking, would have to be called "ultra-ultra-short-term memory". What suddenly, sometimes during the treatment, is the patient clicking back into the world can only be the re-establishment of the connection with the information source in the universe. The Forever Needles are themselves dipoles, i.e. antennas. They restore the connection to the original source of information. The energy that the Forever Needles receive from the morphic field is directed through the corresponding points on the ear to the appropriate organs. With this energy, the cells can build up their resting potential again and thus become functional again. Some of the nerve cells were not dead but simply had too little energy before the treatment. That would also explain the super fast healing with the Forever Needles. This would also be the case if the resting potential of the cells was reduced by toxins such as aluminium.

To what happens in the brain and nerve cells I call it the "solid part of memory" and to the part in the universe that is related to it I say "subtle part" or "morphic field". I end the dispute about whether one or the other is correct with the fact that both together as a whole can only realise the memory functions.

Quantum-physical explanation of the healing energy of the Forever Needles

Everyone knows from school that antennas receive the electromagnetic waves of the radio transmitter. These waves are converted into energy and information by the receiver. This makes it possible to listen to the radio, for example, without seeing or feeling the waves.

The antennas must only have the ability to realise electrical charge displacements, i.e. have conductivity for electrical current. With short "antennas", one rather speaks of dipoles or detectors. The energy described, measured and also used by Tesla for his car is the so-called zero-point energy. Zero-point energy is the energy that can also be detected in a vacuum. The name "zero-point energy" comes from the fact that people used to believe that there was no energy in a vacuum. It is also called space energy, e.g. by Prof. Claus W. Turtur. It corresponds to the free energy that Tesla discovered and with which his car drove up to 140 km/h without any other energy source.

Which wavelengths the antennas receive from the zero-point field depends on their length or, in this case, the titanium ear implants, called "Forever Needles". Depending on the oscillation mode, the antenna length corresponds to e.g. a quarter or a half wavelength of the received waves. In mathematical terms, the determined wavelength is a function of the length of the dipole. The analogy to radio technology is obvious. The wavelength is inversely proportional to the frequency. The frequency corresponds to a mathematically calculable energy.

There are ionising and non-ionising electromagnetic rays in our world.

Ionising rays have an energy of $> 5\text{eV}$ (electron volt = usual unit of measurement for energy in atomic physics). In other words, the energy of more than 5eV . This high energy damages biological cells and tissues because it knocks electrons out of the atoms of the molecules and thus forms the well-known free radicals. The free radicals then destroy biological structures and are also the cause of ageing processes and diseases. Examples of ionising radiation are electrosmog such as mobile phone radiation, X-rays, gamma rays of atomic energy, etc.

Non-ionising rays have energy of $< 5\text{eV}$, i.e. less than 5eV . They benefit biological cells and tissues. They also have the property of penetrating biological structures very well. Their lower energy is absorbed by the cells and utilised for their biological activity. These include, for example, space energy (free energy) and solar energy. Solar energy contains many life-friendly photons.

Until now, medicine has only seen the following: For the nerve cell to work, it must first have built up sufficient membrane potential (Membran voltage). For this, the nerve cell needs ATP, the universal energy currency of all cells. In its function as an information transmitter, it consumes ATP. If not enough ATP can be supplied for various reasons, the nerve cell can no longer perform its function.

Another source of energy that has not been considered so far is the non-ionising electromagnetic rays, also called free energy. These are always around us and come from outer space. That is why they are called "space energy".

The Forever Needles are dipoles that receive the non-ionising electromagnetic rays, the space energy. According to various research, these rays can penetrate biological structures and supply them with energy. The special feature of the Forever Needle Therapy is that the whole body is imaged on the ear and by placing the titanium tips on the corresponding areas on the auricle, all brain and body regions are supplied with zero-point energy (free energy / space energy) and information via the finest energy pathways (microtubules according to Fritz Albert Popp).

This ability of the non-ionising electromagnetic rays explains the Alzheimer's miracle cures: These rays raise the membrane potential and the previously inactive nerve cells can carry out their functions again. In other words, they can receive and transmit information again. Patients and relatives report again and again about "clicking into the world". After placing the needles, we could always observe an improved perception as a phenomenon of seconds. The patients began to take an interest in their environment again and were able to react and act with speech and behaviour again. The objective proof of this is the MMSE tests before and after the treatment.

Prof. Claus W. Turtur, Professor of Physics, has calculated for this book the free energy added to the body by an Forever Needle:

The titanium micro-implants used are 1.2 mm long. This results in the energy of photons whose wavelength in the wave image corresponds to twice or four times the length of the antenna. For a needle, this is 2.6×10^{-4} eV.

The energy absorbed by the Forever Needles and transferred to the tissue is calculated to be 2.6×10^{-4} eV. This is the energy absorbed by a single Forever Needle and transferred to the tissue. Experience shows that a single Forever Needle does not have a lasting effect. There is also the physiological mechanism of habituation. In severe diseases such as Alzheimer's or Parkinson's, we need 100, 150 or sometimes even 200 needles. The number of needles depends on the severity of the disease and any co-morbidities. For a lasting, i.e. lifelong positive effect, the following sufficient amplification is added from a physical point of view: If n is the number of needles, this results in an intensity that can reach a maximum of n^2 . The prerequisite for the maximum amplification factor is a phase-correct (in terms of constructive interference) superposition.

With 100 needles this means an intensity of $100^2 = 10,000$, with 200 needles $200^2 = 40,000$. However, the intensity resulting from the superposition of the waves does not increase the electron volt number, but is intensity = energy / area / time and is given in photons per cm^2 . This results in the following intensity due to the property of waves to superimpose: $I = 2,6 \text{ eV} \times 10^{-4} \times 100^2 = 2,6 \text{ eV} / \text{area} / \text{time}$. Consequently, the superposition by increasing the number of needles cannot produce ionising rays above 5 eV but only increases the positive effect.

This physical calculation therefore agrees with the experience of the second Alzheimer's cure. The hypothesis would consequently be: The double Alzheimer's cure is based on the ability of the nerve cells, after the transmission of the free or zero-point energy through the mediation of the Forever Needles, to increase the membrane potential to form action potentials again.

The additional space energy or free energy transmitted to the organism through the Forever Needles is a very weak, non-ionising, i.e. life-friendly radiation. The experience from my practice agrees with the calculations: For example, the fact that the effect of a single Forever Needle fades after a few weeks. This energy, or the intensity of a single diode, is too weak to provide lasting help.

The experience with Alzheimer's and Parkinson's patients is different: If I take into account all the regions of the brain involved and treat them all, I end up with 100, 150 and sometimes 200 ear micro-implants. When the number of "needles" is so large, the factor described above, which increases with the square of the number of needles, is added.

The healing in seconds for Alzheimer's patients who did not talk for months or years and did not understand anything and seemingly knew nothing anymore is now quite easy to understand after this derivation:

"Atrophied neurons" in the brain could no longer build up an action potential. At the moment of treatment, when I had implanted the needles for the left-brain language centre in the auricle of the Turkish patient, he began to speak in his mother tongue. When I implanted the needles for the speech centre of the right brain hemisphere, the patient, who lives in Germany, began to speak German, i.e. a foreign language. Is it possible that the speech centre for foreign languages is located on the other side of the brain? Exciting question! We continue to search for answers...

Universal world view

From the materialistic thinking of conventional medicine to the universal worldview

I didn't go to a Christian school, I didn't see the point of looking at pictures of saints. I didn't believe in any church or political party. I only believed in my insights and gradually came to realise that all these institutions were only created for the abuse of power. But I still had my dear God. It is my connection to the luminous spiritual world. My dear God fulfilled all my meaningful, loving and human wishes. I sent my wishes to God and firmly believed in them. I can only remember wishes that came true. From being a slob, first brought up by my father with a beating, I developed into one of the most successful judokas in the GDR through my iron will and belief in my own God. I achieved my victories through mental preparation, in which the fight with all its possibilities played out before my eyes. One day I even managed to defeat an Olympic gold medalist.

As an adolescent, I dealt a lot with ideological questions. Materialism was preached at school and college. I couldn't agree with that, but sometimes I just had to adjust in that way.

At school and during my studies, I was always particularly positive when it came to scientific thinking. During my medical studies, I passed the most difficult hurdle for medical students, the "Physikum" exam in the subjects anatomy, biochemistry and physiology with a 1.0. These subjects require not only memorisation but also contextual thinking and are the fundamental truths of medicine.

After my medical studies in the basic research of pharmacology, from which we developed neurobiology, I was completely taken aback by the purely materialistic explanation of all processes for the first time. Now I realise that is only a small part of the truth. Or to put it better: Materialism was already there. That was solid energy, which consisted of atoms and these in turn consisted of elementary particles. On closer inspection, however, one noticed that the atoms consisted of more than 99.99% empty space. What was in between? In between there could be something inaccessible either to our senses or to technology. It is extremely likely. What also puzzled me was that I was researching the basics of physics, what was the fate of the elementary particles. Elementary particles, such as photons, arose from “nothing” and disappeared into “nothing” when they died. Later I realised that even the elementary particles were only created from energy and converted back into energy and that they were and still are concentrated energy in the form of scalar waves of electromagnetic frequencies. This realisation did not immediately generalise across my entire knowledge. Today I know that on the path of knowledge, there are always moments when you get a completely new worldview in which you have to integrate everything else. From time to time, it is necessary to rethink or even change our thinking.

When I first heard about the spiritual healer Stefanos Iakovidis from Hano-ver, Germany, in 2009, I initially dismissed it as a pipe dream. Afterwards, I had to throw this prejudice overboard by taking a closer look. A time of rethinking and new thinking began for me. I got James Oschman’s book “Energy Medicine - Concepts and Their Scientific Basis”. This opened my eyes to a world that had been closed to me until then.

I was particularly impressed by the experience described above with the Turkish patient who lives in Germany, Mr Veli B. In this patient, the success came while the Alzheimer’s treatment was still in progress.

Acupuncture as a model for energy medicine

Only energy medicine helps to understand the Forever Needle Therapy

Thousands of years, 10,000, 5,000 or 4,000 years, according to different sources, are the first indications that people have been treating themselves with acupuncture, not only in China. Using natural means to protect oneself from health problems, to balance imbalances and disharmonies and to survive in the struggle for survival and life is as old as human history itself. Acupuncture is as much a part of this as anything else. Whether using fish bones, stone points or other tools, historical research has shown that acupuncture has always been where people were. Stimulating the flow of energy where blockages or imbalances have led to reduced performance or even pain is so much more obvious than the bad habit of ingesting unnatural or even toxic substances into the body, by whatever route (mouth, skin, intestine, vein and others).

Nature knows what is good for the body, the mind and the soul. The fruits that are ripe in Spain at certain times of the year are also good for maintaining health. If people are not corrupted by artificial products, hectic, stress, time pressure, greed for money and possessions and other addictions, they have a seventh sense. This is how our ancestors were able to perceive energy in order to act wisely.

Energy medicine fundamentals

The success of acupuncture depends on the accuracy of hitting the points. Hitting the corresponding point of an organ that is disturbed stimulates the flow of energy in such a way that self-healing is accelerated. The energy flows again via the energy channels, which are called “meridians” in Europe. The word comes from sailors who observed acupuncture in China. We now know from our technical investigations that these are channels with a particularly low flow resistance. The energy flows of the meridians reach every small cell and every cell organelle as well as every molecule.

“Everything flows - Pantarei” said the ancient Greeks

The mode of action and the underlying mechanisms of acupuncture can only be understood if one opens up to the fact that living matter functions fundamentally differently from the simple physical processes of technical products. Living organisms are characterised by the fact that they consist of oscillations of electromagnetic waves with mini-currents and biomagnetic phenomena. These processes control and regulate everything in the organism down to the cells and their organelles. Each movement of the macromolecules present in the organism and their interactions with each other are vibrations of electromagnetic energy and at the same time information for the behaviour of every cell of the living organism. The effect of acupuncture is also based on this.

If it doesn't flow and the flow of energy comes to a standstill, there are blockages in the organism. The energy blockage leads to disharmony and imbalances that open the door to illness. Only with the mental opening for these phenomena as a basis can we understand the effect of acupuncture at all. For physicians who have not internalised this fact, the successes of acupuncture remain a mystery.

The saying applies: The whole is more than the sum of its parts. That is a sure thing. There is enough evidence. Rupert Sheldrake explained it from his point of view in his book "The Science Madness - Why materialism has had its end". Kurt Tepperwein explains it in his books, for example in the book "Super-Intuition". With him, holistic recognition is not possible through analytical thinking, i.e. not through dissection into parts.

While Western medicine deals more with the dissection into the smallest parts, organs, tissues, cells, cell organelles, and biochemical processes visible under the electron microscope and thus achieves its findings and successes, the old Chinese medicine sees the whole thing from the outside, also in its own environment with the influence of climatic factors etc. Both are two different ways of seeing and thinking and both aim to heal. Each of them is at the right moment in the right situation.

How does the energy get from the ear point to the target organ?

There are several so-called somatotopes in the human body. Many people know the sole reflex massage. Some know the skull acupuncture by Yamaha Moto from Japan. Neurologists know that the whole human being is imaged upside down on the cerebral cortex. The whole human being is also shown standing upside down on the auricle.

Frenchman Paul Nogier developed the exact ear map. He found the corresponding points on the ear for the organs, parts of the brain, etc. The big toe, for example, is at the top edge of the fossa triangularis (translated: as the triangular pit) of the auricle. Nogier found the corresponding points by irritating the big toe with pain, for example, and found that the electrical resistance of the skin at the corresponding point on the auricle was reduced. In this way, he gradually found all the corresponding points on the auricle up to the parts of the brain. To get a better idea of this, please look at the illustration with the ear and the upside-down embryo.

Via the needles placed in the auricle, the free energy, described by Nicola Tesla, reaches the organs via energy paths (meridians) where the self-healing powers are stimulated in order to correct illnesses or disharmony with the help of thousands and thousands of regulatory mechanisms that the body itself has.

Electromagnetic waves with energy and information propagate along these energy paths. Fritz Albert Popp, who went down in history as the discoverer of important observations, described these energies as coherent light, i.e. laser-like light. He had already published this in the 1950s. Only in 2000 did the biophysicists at the World Congress agree with him. He is regarded as the discoverer of ultra-weak cell radiation.

Various investigations by different scientists and researchers in the world, for example, a Korean, established that the meridians and the other energy channels are small tubules. Stem cells also migrate into these small tubules when stimulated by acupuncture and stimulated by energy.

Our healing or reversal of degenerative nerve diseases with the Forever Needle must also be explained with the formation of stem cells, at least after a long period.

The fact that in patients whose brains have shrunk, function is restored so quickly after the needles are placed, there has to be a new understanding or rethinking of the relationship between structure and function. That is what I mean: If we have seen Alzheimer's patients come right back into the world by healing in seconds, then the shrunken brain must still be able to function.

For me, this means that the brain cannot have grown so quickly and that it later grows and enlarges again through constant use with the help of stem cell formation, among other things. So, in my view, the shrinking or miniaturization of the brain is just the result of underuse.

Try to understand the work of the brain as a whole

Attempts to understand the work of the brain as a whole have been numerous throughout history. The point is that scientists are trying to understand how the parts of the brain work together. A model that explained at least some aspects relatively well to me at the time of my research in neurobiology was the view of Pavlov's student P. K. Anokhin. He wrote the book: "The functional system as the basis of the physiological architecture of the behavioural act". In doing so, Anokhin represented and proved the refference principle he named. In doing so, he attempted for the first time to understand how the central nervous system works as a whole. In its behaviour, which is controlled by the central nervous system, it has incorporated the feedback mechanism refference. In doing so, he laid the foundations of neuro-cybernetics, which attempts to understand the overall system as a result of the interaction of various subsystems that interact with each other. For the first time, it is also clearly shown how the organism can organise itself to react appropriately to all of the simultaneously acting stimuli (situational afferent). It is remarkable, however, that Anokhin postulated an additional "memory apparatus" outside of the brain. I couldn't understand that at the time.

We, the founders of neurobiology, were proponents of the "connectivity hypothesis". That meant: The memory information consists of the "change in interneuronal connectivity". This results in an experience-related change

in the spread of excitement and thus in behaviour. This does not contradict the idea described above that the brain is a "receiver" of information. On the contrary: It corresponds to the interaction between the solid and energy / information and the subtle energy / information located in the universe. As we see today, this explanation is not enough and Anokhin was right after all.

Nevertheless, there are new aspects: Experiences with heart transplants have repeatedly resulted in reports that the organ recipient suddenly noticed the donor's musical talents, for example. This means that information is probably stored throughout the body. On his path of knowledge, David Icke arrives at the hologram principle: Everything in the body knows about everything. Every cell knows about every cell.

In my publication from November 2013 in the Praxis-Magazine on the topic "Healing hands and technical medicine" I also came to this idea independently of him in the discussion part, without having previously known the work of David Icke. For me, it was the explanation for the fact that cancer cells, in contrast to the others, can die off with extreme energetic strengthening because they are excluded from the communication continuum of the organism. They do not resonate with the other cells and thus receive no information, i.e. no more "orders".

We cannot elaborate on the topic here, but I can still say that I have successfully rediscovered the functions taught in neuroanatomy, which are attributed to the individual brain regions, with the help of the Forever Needle Therapy. We know the map of the localisation of individual sensory projection fields designed around 1900 by Korbinian Brodmann, the localisation and the motor language centre, and the frontal regions for

the organisation of action sequences. This could be corrected in each case with disturbances of these functions with the help of the Forever Needle Therapy. Thus, *ex juvantibus*, the Brodmann map was again confirmed to be correct. This was demonstrated by a patient who immediately regained speech intelligibility after needle implantation in the corresponding area of the ear.

Just one example: Thomas B. always turned his head when listening so that he could hear and understand with his right ear. I asked him if he couldn't hear properly with his left ear. He confirmed that he could. I asked him what this inability to hear was. He explained that he could not understand the meaning of the words with his left ear. He hears something with his left ear, but he cannot make out the meaning with his left ear. It was clear to me that this was a disorder of the sensory speech centre, i.e. Wernicke's centre. So I implanted several needles in the appropriate place. After the patient got up from the couch and the needles were implanted, he no longer turned his head so that he could only hear with his right ear. Instead, he was able to look directly at me and said that he now understood the meaning of speech in both ears. I get this kind of neuroanatomical confirmation with every patient.

In Alzheimer's, however, the activation of the limbic system, but also some parts of the cerebrum, is particularly important. Ever since the neurosurgical incident in 1953 in which the hippocampus of patient H.M. was severed and this patient was never able to remember new events, the hippocampus has been the focus of memory research. However, as my dissertation showed, the sensorimotor cortex and certainly the whole brain are also involved.

All previous theories of memory have a grain of truth in them, I will not deny that. Nevertheless, they have a major flaw. That is the energy medicine aspect. It is now clear to me that we are influenced by energy and information from the universe. And that the nerve cells communicate with each other using electromagnetic waves. We are also all connected to each other energetically.

For this edition, I would like to end the discussion of the results. First, I would like to collect more case studies for the next edition.

Spiritual excursion into energy medicine

There are now many spiritual healers. There are sensational successes with good spiritual healers. Some only pretend to be such without any effect. And some negative spiritual healers only want to exploit you and make you dependent and even send bad energies. You have to be careful of that. I have had good and bad experiences with them. My most negative experience with them was such that I walked around "like counterfeit money" and was no longer myself.

I would like to tell you about three good spiritual healers who always helped me when I needed it: Stefanos Iakovidis, Adam Jacob and Ursula Frey.

Stefanos Iakovides

Stefanos Iakovides was the impetus for me to say goodbye to the sole view of the solid-material energy.

In November 2013, I reported on Stefanos' healing successes in Praxis-magazin. I took the scientific basis for explaining this kind of ability from James Oschman's work „Energy medicine - concepts and their scientific basis“. If you want to convince yourself of this, you can get this book. In this book, you can also see that the energy of such extraordinary healers was measured and registered. This also provided proof that in 1779 Franz Mesmer was right when he showed that he could heal with the laying on of hands. We find bioelectromagnetic phenomena everywhere where there are living organisms. Even in acupuncture, I observe that the needles are magnetically attracted to the right points. But the average intelligent person only believes what he can see, touch and hear. But that is only a very small part of reality. For example, we know from light that we can only see in the wavelengths of 400 to 700 nanometres. Some people also know that there is also ultralight and ultraviolet light. Both of these are at the extended beginning and end of the spectrum respectively, which we can no longer see.

So we can say that only parts of reality are accessible to our sense organs. Therefore, we should detach ourselves from believing that we know everything. There is much that is simply not accessible to our sense organs and yet exists. In the meantime, I have hundreds of proofs about Stefanos' abilities. For example, there are the following situations:

A friend of mine told me on the phone: I have a subdural haemorrhage (arterial bleeding in the skull). That was the diagnosis. This diagnosis terrifies every doctor: 50% of patients die on the way to the hospital, of the 50% who arrive alive, half die in the hospital and the other half become crippled with permanent brain damage. I asked my friend what he did. He said: "I have a spiritual healer here." I was speechless and thought: You'll probably never hear from him again. Against all expectations, he called me six weeks later. I was very surprised and wanted to meet this spiritual healer. So Stefanos had to come to Spain because I needed to know what he had done to my friend.

He told me about several cases, but in such detail that I had to believe in his healing powers. Then I said please give me this healing energy. What did I see? Stefanos was moving along the course of the acupuncture meridians at a distance of about 3 cm. "Do you know the meridians?" I asked him. "No," he said. I just feel the energy flowing there. Now it was clear to me that the ancient Chinese must have had this seventh sense, and Stefanos has now regained it after his near-death experience. In the meantime, he has been practising remote-control lunges for a long time. To do this, he needs a picture and the patient's details for identification. By concentrating on the picture, the person receives energy. Weak health points, and in some cases diseases, disappear in the same way as with acupuncture.

The only difference to the Forever Needle is that the Forever Needle absorbs energy from the Universe for the rest of the patient's life, as long as it is in the auricle, and gives energy to the patient for life. This leads to faster healing after accidents, operations and other illnesses throughout life. Life expectancy is higher.

But sometimes I have Stefanos send energy in addition to the Forever Needles to increase the effect. This works very well, especially with Alzheimer's and other forms of dementia. The patients with the Forever Needles absorb his energy particularly well. Obviously, the cerebral cortex is activated.

Another story I experienced with Stefanos: In 2009, a world-famous actress came to me under a deck name. Her name was Shirley MacLaine. She had heard about me from a doctor in Los Angeles, Leroy Perry MD. Leroy had published the article: "Doctor Werth makes a good point" in a Californian magazine. That's how I became known there. Shirley admitted who she really was during the treatment. It was various aches and pains that I took away from her with the needles. She was very sympathetic to me. We exchanged mobile numbers and kept in touch. In 2011, she was in Gran Canaria because they were shooting a film with her again. At that time she was 77 years old and wanted the help of my needles for the rest of the filming because she was so exhausted. I flew there and treated her. Her body reacted in the way that was best for her: She slept it off. After two days, a press conference was to be held. The star Shirley MacLaine was to be celebrated. All the celebrities were there, but Shirley was asleep. The guests were already scolding me: The doctor put her to sleep with his needles. Now I guess we all came for nothing. At that moment I remembered Stefanos. I called him at his home in Hannover: "Please help me, Shirley MacLaine is sleeping through the press conference and it's supposed to be my fault." Stefanos said: "I'll send her energy over the distance and she'll wake up." Five minutes later, Shirley called me: "I slept wonderfully well. You may want to be patient. I'll be right there." So it was: Shirley had slept herself several years younger and appeared in top form. She made a great speech and answered questions eloquently. At the ceremony that followed, she took me in her arms and said: "You are my friend. I thank you from the bottom of my heart." Stefanos had thus saved me and the press conference.

Other examples: Before my oral Spanish exam, the day before, I was still in such a bad mood that I had to laboriously search my memory for every word for every sentence. The next day was the oral exam. Stefanos received the WhatsApp from me: "Now I'm in the exam. Please send me energy!" Suddenly I was talking "like a waterfall" in Spanish. Words I had last used 10 years ago were used all by themselves in the right context. The examiners rose from their seats and said: "We wouldn't have thought you capable of that. Grade "Very Good"."

During my regular ultra-long endurance runs, when I fear I won't reach the finish line, Stefanos has to send energy.

When my beloved oversleep and I can't reach her by phone from another place, Stefanos has to send her energy. Three minutes later she calls me. That always works. Stefanos' wake-up energy by activating the cerebral cortex has always worked, and that is what best supports my Forever Needle effect on Alzheimer's. Those who have not experienced this do not believe it. But if you want to know for sure, you can try it.

Adam Jacob

Sometimes I have been helped by the old master of spirit and energy healing Adam Jacob from Munich. He can send energy, but he can also be clairvoyant. Through him I am monitored and protected: Once when I was travelling and had insane pain in my second toe on the left, he called me: "You are getting blood poisoning from the toe. Please go to a hospital!" He was right. When I got home, I had to go to the emergency room. It was just in time.

When I first met my sweetheart, we were instantly in love and both felt we belonged together, as if it was fate. The next day Adam called: "I got the information from upstairs: You met the woman of your life yesterday." It had been true.

He also works with the so-called earth acupuncture. In this method, huge tree trunks are buried at very specific points on the earth in analogy to acupuncture, because they free the respective region from harmful energies and earth disturbance fields.

Ursula Frey

Ursula Frey had told me the same thing on the phone. She had also been watching me and had helped me with her energy to be so open to the new love. Sometimes she sends us harmonising energy, or better love energy when we have „dissonances“, i.e. a little quarrel in the relationship. Ten minutes later we are always reconciled. Often I don't even tell my beloved so that it is attributed to me. But it always works.

Technical energy healing and other methods of energy medicine

“Healing hands and technical medicine” was the title of my publication in *Praxismagazin* in November 2013, for which I studied James Oshman’s comprehensive book “Energy medicine: concepts and their scientific basis”. There is thousands of evidence for energy medicine and energy or spiritual healers. In 1779, Franz Messmer showed the doctors his art of healing with the laying on of hands. He was mocked and ridiculed by the doctors. In my medical studies, we learnt something else about Franz Messner, namely that it was a kind of superstition to believe in the healing power of laid hands. Meanwhile, more than 200 years after Franz Messner, technical measurements show that energy healing is actually the normal thing to do.

Doctor Zimmermann in California was able to measure and record the electromagnetic waves emitted by healing hands. He even mapped these waves and showed that the healer automatically emits waves that are suitable for restoring the diseased tissue. This means that the frequencies of the patient and the healer are related. The frequencies emitted by energy or spiritual healers automatically adapt to what needs to be healed in the sick person.

Today, technical medicine has reached the point where it can measurably prove “errors” by the arrogance of doctors. In medicine, it can take centuries for a method to be recognised as a cure. There is a saying: “Health and death take away the doctor’s bread and butter. It is terrible, but it is true, and I have felt it often enough in my own body, that healing is only wanted in appearance, but in reality, it is condemned.

Professor Enrico Edinger, based on some secret information from space medicine, had set up an institute capable of measuring human energies with technical means and sending healing energies to patients over great distances by emitting appropriate frequencies.

Alexander Rzeznicek is an inventive doctor. He has now developed "Transcranial Magnetic Stimulation". My beloved overcame her insomnia in three days with five 20-minute sessions a day using the dominant theta-wave sleep frequency. For me, all previous emotional traumas have become a distant memory and I feel mentally reborn. Energy healing makes apparent miracles possible.

As a rule, I prefer the living spiritual healers to the technical methods. But I don't want to be judgmental. Everyone must decide for themselves which method they prefer. I cannot talk to a machine or an automaton and I cannot reveal any feelings. Like all human beings, I need human contact with human warmth.

FAQs - Frequently Asked Questions

Does the method have side effects?

No, it can only make everything better and bring it into balance.

Does this method have any risks?

In 7,000 patients from all parts of the world, mostly with Parkinson's, three scratched the small wounds that had just closed with their finger-nails immediately after the treatment, thereby triggering an inflammation that disappeared within two hours by taking the antibiotic clindamycin.

Are the severity and stage of the disease barriers to therapy?

No, the most difficult cases are described in the case studies with subsequent incredible success. Only dead brain tissue that has been transformed into connective tissue can be a hindrance because it can stand in the way of regeneration. In addition, the total outflow obstacles of the brain water (Liquor cerebrospinalis).

Is there an alternative to this Forever Needle Therapy?

No, no such healing and risk-free Alzheimer's therapy is known. Neither the planned vaccination nor any medication was even remotely capable of bringing about these healing successes, and it will probably stay that way. Any artificial intervention in the finely tuned control processes can only lead to deterioration and side effects. With Forever Needle Therapy, the body does everything itself. Therefore, there can only be improvements in health.

Do the needles bother you or do you see them?

They don't bother you because there are no pain or other receptors in the layer of connective tissue between the skin of the ear and the cartilage. Once the needles have grown in, they are not even noticed. You don't see them at all or only in a few places.

An additional interesting observation: If the needles are later prompted by the body to have an increased effect, there is a slight pull in the auricles. Two examples: A patient has a concussion. As a result, the body first needs the energy to repair the consequences. During this time, the symptoms of the originally treated disease had reappeared. As long as the needles have to work even harder, your ears feel as if they were freshly planted. When the symptoms of the original disease have disappeared, it stops pulling.

Do the needles in the magnetic resonance tomogram, i.e. the MRT, interfere?

No, the micro-implants that are implanted in the auricles of our patients are made of unalloyed medical-grade titanium and cannot be magnetised.

Regarding the compatibility (biocompatibility) of titanium implants: Biocompatibility can be defined as the safety of a material in a biological environment. If you look at the chemical composition of pure titanium, you will notice that it is not 100% pure, but "only" has a degree of purity of around 99.5%. However, it should be noted here that none of the trace elements such as iron, oxygen, hydrogen, carbon and nitrogen contained in titanium are known to be in any way toxic.

On the safety of titanium implants in MRI examinations:

The Ulm University Hospital writes about the harmlessness of MRI examinations: If the implants in joint prostheses or metal implants are made of titanium, an MRI examination is possible without any problems six weeks after implantation.

Titanium aneurysm clips are considered safe for MRI scans.

On the occurrence of artefacts (image disturbances) in the MRI:

With non-ferromagnetic materials, such as copper, silver or titanium, the image disturbance is based on small currents that arise within these implants as a result of the high-frequency pulses. Titan appears to be doing particularly well in this regard.

This excludes all risk factors related to MRI examinations in the "Forever Needle Therapy".

When checked at the airport, it doesn't beep because the mass is too small. A needle has the dimensions of 0.6mm x 1.2mm.

Can the needles wander?

No, they are wrapped in a titanium-triggered connective tissue sheath between the auricular skin and the ear cartilage. I was able to prove this 19 years ago by dissecting it. Further evidence has been provided by overlaid X-rays year after year and testimonies from hundreds of patients. Patients of Bahr MD reported that whole "wandering search parties" of acupuncture doctors searched for wandering needles for years to discredit my method, but nothing was found.

So calm down, that doesn't exist and if there was, I certainly wouldn't have treated myself with the implanted needles. I myself have most of the titanium micro-implants in my ears after I decided to treat myself with my invention for the first time in 2014. In the meantime, I have used it to treat illnesses such as vertigo attacks such as Menier's disease and many other things myself.

Can the needles be removed?

Yes, but that is not intended because they help. They always work when the body needs them, i.e. when something needs to be brought into balance. In the case of chronic diseases such as Parkinson's or Alzheimer's, this is absolutely necessary, because experience shows that the disease would otherwise come back.

An example in Parkinson's: A Parkinson's patient allowed himself to be persuaded that the implanted titanium damages the ears like heavy metal poisoning and had the titanium tips removed. Parkinson's came back in full force afterwards and he had the needles implanted again like the first time. This led to a regression of the Parkinson's syndrome.

Can the needles cause overstimulation?

No, the Forver Needle Therapy causes the body to bring everything into balance by activating the energy pathways in accordance with the Chinese meridians, but not out of balance. For example, the so-called hunger point can help with both obesity and anorexia, because acupuncture only makes everything normal. High blood pressure comes within the normal range with the same points as low blood pressure.

They work the way the body needs them if they are in the right spots. One could say: acupuncture acts like a catalyst for self-healing powers.

Is there a material intolerance or an allergy to the titanium needles?

No, it does not exist. I have treated 7,000 patients or more on this earth. No material intolerance or allergy could be observed anywhere. To be on the safe side, I asked a specialist, a medical professor who dealt with the question of whether there was any material incompatibility with titanium and investigated this with patients coming from all over the world. This professor assured me there is absolutely nothing to worry about. He had never seen intolerance to titanium in thousands of patients with titanium implants. He said that if there are sometimes intolerance reactions with dental implants, then this must be attributed to other additives, but not to the titanium.

Is titanium a heavy metal?

No, it is valued for its lightness, strength and absolute tolerability. It is harder than diamond and can therefore only be processed with special technologies. Its connective tissue proliferating effect in the organism helps artificial joints to become firm and the Forever Needle to prevent the "needle migration" that this excludes.

Are there positive influences on patient recovery after needle implantation?

A particularly loving approach to the patient is very important for the regression of Alzheimer's disease after needle implantation. This is usually because relatives or friends have read up on the therapy and come to see me in Mallorca. They want to do everything they can to make their loved ones feel better. A sense of achievement stabilises the success of the treatment. Activation of the nucleus acumbens, also known as the happiness nucleus, leads to better storage and integration of information. This is part of the mesolimbic system in the brain. Other important positive influences include a meaningful purpose in life, a favourite hobby, exercise and diet.

In my deep psychological training with the famous teacher Hans Joachim Maaz, I learned that a love relationship can only be as good as it is freed from the traces of old stressful experiences, or freed by the couple through self-reflection. My famous teacher was right about that.

Are there negative influences on patient recovery after needle implantation?

Negative experiences, such as reprimands if the patient has done something wrong or forgotten something, have a negative effect on the stabilisation of regained cognitive functions. The amygdala, part of the brain's limbic system, is activated. The amygdala is particularly responsible for storing negative experiences.

Other negative influences are pharmacologically deep anaesthesia, corticoids (cortisone, prednisolone, dexamethasone, hydrocortisone, etc.) and opium and morphine derivatives, the drugs "Memantin" and "Amantadin".

Is it possible to treat complaints or pathological conditions from which patients suffer even if they have not yet been diagnosed?

Yes, the Forever Needle is used to treat symptoms and complaints. The body is encouraged to put everything in order with thousands of control mechanisms.

What determines the choice of points and the number of needles?

Mainly on the type and severity of the complaint, but also on the findings of conventional medicine.

Can you treat one disease alone and not the others that the patient is also suffering from?

No, the holistic principle requires everything to be treated at the same time because the energy cycle must be closed. Then it helps best for each individual.

What are the possibilities for other diseases of the central nervous system?

Also very good. Diseases of the brain in particular can be influenced well because the plasticity of the brain suits us.

What mechanism underlies the effect of the micro-implants in the auricles?

Biophysicists say: The needles are like small antennas for free energy according to Tesla and, because of their special length and the selection of the special corresponding points to the respective organs, supply them with this energy to activate the body's own control mechanisms for healing and regeneration.

Which studies, which patient reports, and which observations and experiences are there about the method?

There are many patient reports, studies and publications related to Parkinson's cure. These have already been described in previous books and in the presentation at the June 17, 2001, World Acupuncture Congress. Unfortunately, all of the studies I planned to cure Alzheimer's were prevented by the German authorities. Therefore, there are only patient reports on it.

Are there patients for whom it has not helped at all?

No, the Forever Needle Therapy always helps because it supplies healing energy. It is not possible to say with certainty whether complete healing occurs or whether residues remain. If other diseases come later, the effect can be reduced. Then the patients are asked to contact us for advice.

Forever Needle Therapy cannot promise that an accident or another illness will never be acquired later. Nor can it promise eternal life.

Can you put us in touch with reference patients who can tell us how the therapy went for them?

Yes, we're happy to do that. Many are already familiar with the helpful effects in YouTube videos under "Dr. Ulrich Werth" performed. You can find our channel at youtube.com/@foreverneedle

How many needles will there be at the end of the therapy if the patient has several illnesses and complaints and they all have to be treated at the same time?

This varies greatly and depends, among other things, on the severity of the symptoms. With Parkinson's or Alzheimer's, for example, it can be over 100. With other disorders, e.g. with an eating disorder, it can be much less.

Why does the inventor Doctor Werth attach so much importance to the patients and their relatives and friends freeing themselves from purely conventional medical thinking?

Every patient and the family needs to know what is happening and how it works. Therefore, they should engage with the books, the website, and the videos.

Why don't the health insurance companies pay for the treatment with the Forever Needles if they save a lot of money by doing so?

The disciplinary superior of the health insurance companies is also on the supervisory board of the pharmaceutical industry and this has no interest in savings.

Where is the system upside down?

In Germany, it can only be billed if you are ill. The more diseases the more can be earned. Health is bad for the whole system. Therefore, the whole system is very harmful to health or even deadly.

The black hand in the background

You may be wondering why no Alzheimer's study has been published yet. The situation in the world today shows it more than ever: We do not have an ideal world, and certainly not a world where goodness and humanity rule. In the background, the scum of humanity rules: The greed for money and power with the oppression of those who want human things like freedom, healing and equality. I already knew this from the Stasi time in the GDR, as I described above, and now I see it even more. Even though we know it: "The greatest villain in the whole country is and remains the informer". The networks of traitors have often remained the same. Karl-Otto Launicke was Stasi Minister Mielke's bronze medallist and is now the prosecution's chief witness in the corruption trial in which the "black hand in the background" tried to destroy me. The embarrassment for prosecutor T. did not become a scandal. The files on it quietly disappeared. But everything remained as it was. We can see this in the following true story.

All of my attempts to carry out a study to prove Alzheimer's healing with my method were prevented by the "black hand in the background". I will summarise this:

After my success with Graziella Forera in Bogota, I wanted to carry out a study in neurology at the Ernst von Bergmann Clinic in Potsdam. I introduced myself to the chief physician and explained my plan to him. At first, he couldn't say no. Later he put me off several times until, after numerous excuses such as "It was tied too high." and "I don't have enough time for it."

I soon had an Alzheimer's study sponsor, a millionaire whose husband I had successfully cured of Lewis Body Dementia. I summoned Prof. Alexandra H. as a neurologist, a nuclear medicine specialist from Frankfurt and a laboratory specialist in Frankfurt. The study design for a double-blind study was created. Then the neurologist jumped off, afraid of the black hand. All she told me was: "Any doctor who helps you with the study, they're going to crush you." So it should be a university, I thought because it has more power and influence.

So I turned to the Dean of the Hamburg University for Human Movement Sciences and Psychology, Prof. Klaus-Michael Braumann. He was excited. I was able to show him the video with Peter Kaess in the meantime. The university believed in success and knew that if the project succeeded, there would be funding and fame without end. The office from Saxony-Anhalt had to certify that my professional license, which I had acquired in the meantime, was linked to the license to work in Hamburg. The Dean issued several appraisals with the greatest praise for the reinstatement of the previously illegally revoked and illegally not reinstated license to practise medicine. Because I had sat in there and he was able to really assess me and, above all, the fact that I can cure Alzheimer's. There was no response from the Saxony-Anhalt state examination office. I called there several times. The employee Michaela K. stuttered a bit. I learned that Marion R. would have to decide there. She was never available. Months passed and my work permit expired.

But I didn't give up: I spontaneously took the floor at a major event in Hamburg about health through sport. I had a lot to say about that too. The medical association and senator who were present were thrilled. I received approval to conduct the study as a visiting doctor with the Spanish medical license I have to this day.

After I had been allowed to work there for a few weeks, I received a defamatory letter from the state health inspectorate in Hamburg. I had to stop working in Hamburg immediately. I had a two-day right of appeal to refute the fabricated accusations.

By chance, I caught the person responsible, Mr Gründken, in Hamburg. He was completely confused on the phone: Nothing was allowed to happen, he stuttered. Later I tried to reach him again, but he kept denying everything. I knew it was the same black hand in the background.

Later I got a glimpse of the 1500-page secret file on me. I could see that the officials have a fool's freedom. They can slander as much as they like. They have such special rights before the law that it is useless to fight them. Poor illegal state!

**But it's not all over yet:
The system won't survive forever like this.**

The effectiveness of my therapy for Alzheimer's disease must now be proven in numerous case studies. Alzheimer's never gets better on its own. So the before and after improvements will have to do for now. In any case, it is not my fault that no high-profile journal has published the Nobel Prize-worthy treatments. Thanks to questioning, I continue to work for those who see through the system, so that I can at least help these people.

The Forever Needle in brief as anecdotes

The twist of fate with my groundbreaking doctoral thesis and how I was shaped into an absolute scientist

Nothing happens for free. At the end of my medical studies, I was desperate to do research that would truly revolutionise medicine. In my search, I heard colleagues say the following: "If you want to do research in the GDR, you can only do it with Prof. Hansjürgen Matthies at the University of Magdeburg." So I immediately went to see him. After a short conversation, he said: "It's clear: You came here on 1 September 1972 and started here. We already have a subject for you. My question was: "Can I get something in writing for this?" His reply was: "What I am saying is worth more than any written document. Paper is worth nothing." And so it was, showing his extraordinary power. When I arrived at my future workplace in the electrophysiology department, I saw a vast array of interconnected electronic devices. They came from Japan and all over the world. As a very young doctor, I didn't worry about the cost or how they were made.

Then Hansjürgen Matthies' deputy gave me the topic. It was: "Influencing conditioning-related changes in the stimulus responses of cortical neurons by microiontophoretic application of transmitters". It was only gradually that I understood what it meant. I was investigating the functioning of short-term memory, using a method that was utopian for ordinary doctors and still unsurpassed today. A colleague used to greet me half-jokingly, half seriously: "Well, you're not far from the Nobel Prize."

I didn't care what they say. The main thing was that I got the action potentials of the individual nerve cells properly derived and was soon able to see how the picomol doses of the transmitters such as acetylcholine, adrenaline, noradrenaline, glutamic acid and gamma-aminobutyric acid brought to the individual nerve cells were based on learning processes, i.e. affect the formation of conditional links and whether this was even possible. If

not, my work would have been in vain and the doctor's hat could have been forgotten. Nobody knew that either. From time to time I was told by the staff: "You only get a doctorate here if the results and your work was written about them, including successful defence, are world-class." I saw how other employees saw the results after nine years of painstaking research as were not rejected as "world-class". That didn't shake me and I thought it was fair from my perspective at the time. It required extreme perseverance. But then the experiments worked and the results were amazing.

During my research, Prof. Matthies organised an international conference on the current state of memory research. I was amazed when, at this conference, thousands of scientists from all countries and regions gathered in a huge hall in Magdeburg to discuss brain research. A whole swarm followed me into my apartment, which was very small at the time, to find out something about me. My wife at the time said: "They are still crazy people like you. You speak a language I don't understand. Are you all from another planet? I do not understand the world anymore."

The defence came. Beforehand, the future rector of the university asked me privately as the reviewer of the doctoral thesis: "What grade should I give you for this, because I don't understand a word of it. Do you want magna cum laude?" I said: "It doesn't matter at all. What's a grade? Give it cum laude!"

After the defence, which eclipsed everything that had happened at the university before, I happened to bump into the chief secretary of the university mental hospital. I hugged her kissed her and exclaimed: "Now you can call me doctor!" I didn't like that before, because all doctors without real scientific achievements were addressed like that.

At the doctor's ceremony afterwards, the professor, who was not mentally up to the task, constantly talked about his guilty conscience because he had not given me the grade "magna cum laude". I just thought: That stupidity has to be punished and said: "Stop with that nonsense!"

Hansjürgen Matthies and his influence had left their mark on me. He told me: "Look at the professors! As soon as they have the title, they start to get stupid". More than I was aware of at the time, which had determined the rest of my life. It was nothing but the truth, and more now than then...

My way with the Forever Needle

I experienced a lot on my way through medicine to the discovery of the Forever Needle. Mainly good people and bad people. The Forever Needle decides what true character people have. Will the good win, that people really want to help, or greed for profit? Many companions have fallen by the wayside on my way. I found out for myself: It is best to live boldly! The Forever Needle is not for the faint of heart.

A patient report in the TV magazine RTV in 2005 caused the telephone network in my practice in Magdeburg to collapse

Mrs K. wrote a report about her recovery from Parkinson's disease in RTV magazine. The phone then rang continuously. A nurse distributed appointments and a telephone team answered questions about the method for the patients. When I went to Doctor Hüge in Magdeburg to buy some health supplies, I asked him why he hadn't called me. He replied: You can't get through to them anymore. Evchen from the practice team said: Today we made 76 appointments for Parkinson's patients and other diseases. The next half year is now full. From this event, one can see how great the need is to be cured of such so-called incurable diseases such as Parkinson's or Alzheimer's.

In 2022 we tried to get another report in RTV magazine. Even for a lot of money for a small ad, it was not possible, our request was rejected without justification. Large-format advertising for questionable dietary supplements, on the other hand, was very popular. Now you know why my method isn't very well known yet: I'm not allowed to advertise in mainstream media. Today, in 2023, RTV is bankrupt. Evil comes back to evil.

A big hate article also brings in patients

In the meantime, many people have woken up and realised that taking conventional medicine medication has many disadvantages, at least in the long term. Of course, the pharmaceutical industry had to do something about it.

There was a huge article in a major daily newspaper titled "The Forever Needle: Expensive, but not recommended". Of course, there were a lot of negative things about me in the article.

A patient brought this article and showed me that under the article it was very small and just legible: "Pharmafirma Schwarz". He said, "If they're going to such lengths against you, then your therapy must be good."

Many patients followed his example and today there are even more who think like this. Only those who have awakened can be freed from their terrible suffering. Good comes back to good.

A patient in a hurry

One day I got a call: "I absolutely have to come to you this week." I explained that this was not possible. And I asked the patient why he was in such a hurry. "Do you happen to work in the pharmaceutical industry?" The patient had to say yes. He is one example of many showing that those who profit from the sale of medicines don't want to take their pills themselves. After all, you know that it doesn't make the disease better but ultimately ruins your health completely.

The rushing and bought professors talk in private quite differently than they have to act for money

A few years ago, I treated a colleague, who was also a doctor for Parkinson's, which is also a neurodegenerative disease like Alzheimer's. The colleague was from Tübingen and was also treated there by a competent professor from the university. The professor found that patients with much less Parkinson's medication would have a much better quality of life thanks to the Forever Needle. He told her privately: "If I got this disease, I would have to go to Dr Werth." I hear such statements again and again. They are only made in private. Officially you have to fight that damn Doctor Werth of course rushing, lying and so on.

The dream team: One for all and all for one

In Magdeburg, I had a dream team with the motto "One for all and all for one." Just like the Musketeers. The so-called constitutional state, which in reality is a state of injustice, did not stand idle against me: During two house searches, all patient files were confiscated. This made it very difficult for me to provide follow-up care. After all, I can treat all my patients free of charge. After the house searches, my dream team was questioned one by one. Sister Gabi told me: "None of us would make it difficult for you. Nadine was even asked if she would rather go to prison than incriminate her boss. Nadine replied: "Yes. We all stand by him, he only does good." Good comes back to good.

The house search in 2007

In January 2007, I was cycling a short distance on the footpath. Then 8 people stopped me and introduced themselves as the police. I said: "Is it because I was cycling on the pavement?" "No", said one of the policemen. "We have a warrant to search your house". I said: "Well, let me let you in. Then search everything you think and want, but please don't make a mess!" I could be there, the police chief said. I said: "No, thank you, I want to look into my practice. I'll leave him the key, please put it in the letterbox when you're finished."

By the time I got to the practice, there were even more police searching the house. The staff, sister Doreen told me, had been lined up against the wall like criminals. It was a mental shock for Doreen. Recently, senior doctors who have been treated by us have said that they have never found such a competent and dedicated team anywhere else, and that is why they came to us with a lot of confidence. We were an island of happiness for both staff and patients. But it was a thorn in the side of the health system.

When I'm on the plane, I'm free

A few days later I had a visit to Valencia in Spain, which I had booked before the house search. I had such good memories of Valencia because a press conference with me had recently been organised there. My interview was published in all the mainstream media. I had no intention of staying there until I got to the airport. But when I saw the Air Berlin plane, I realised that the corrupt state wanted to destroy me at any cost. So I decided at the airport not to take the flight back. Once I was on the plane, I realised that I was free. I didn't speak a word of Spanish and I was already 58 years old, but I knew that if the therapy helped as much as I had seen it, I would be able to get back on my feet in Spain and build a life for myself. That's the way it is: Good things come back to good.

He who heals must be destroyed

One day in early 2010, I asked the postman in Valencia if there was any mail for me. After introducing myself, he gave me a large letter in a large envelope, and I had to sign for it. He said to me: "I have been carrying this letter around with me for nine months." When I opened the envelope, I saw that it was an accusation. I flew with this letter to my lawyer Dr Michael Nagel in Hannover. After extensive discussions and the presentation of evidence by me, Michael Nagel came to the following conclusion: "The accusations are not true at all. Then there can be no trial. I'll write a statement of defence and then it should be over."

At first, I was not worried and believed him because he was one of the best lawyers in Germany. A few weeks later, against all expectations, he flew to Valencia to talk to me about a trial that had already been scheduled. Since I had a clear conscience and had always acted to the best of my knowledge and belief, it was no problem for me to fly to Germany for the trial.

It became clear to me that this supposedly constitutional state had in fact disgraced itself to the bone with this affair. One of the prosecution's main witnesses, Karl-Otto Launicke, who had been awarded the bronze medal by the Stasi traitor Minister Mielke, went mad at me. Until the prosecutor asked: "Do you have any names of patients who feel betrayed?" Then he pulled out a list of names. It was a list of my friends. But it did not say that they were my friends. The list had been stolen from the computer in my practice in Magdeburg before the house was searched. This was a criminal offence in more ways than one. My lawyers applied for these people to appear here as witnesses. After much discussion and deliberation by the court, it was decided that they did not want to hear these witnesses. My lawyer said to the prosecutor: "Mr Prosecutor, are you aware that this witness is a case for you?" To which the Prosecutor replied in a very bitchy manner: "I know that myself, Mr Attorney." Karl-Otto Launicke voluntarily

committed himself to a psychiatric hospital. The lawyers' questions had made him ill. It was clear that he wanted to escape punishment for making false statements.

The next star witness was Inga Gerstendorf. She had hoped in vain for millions when she was my manager. The contract actually said that she was responsible for everything, including invoicing, etc. However, the court did not want to see the contract. The testimony of this witness caused the court to smile and sometimes to laugh.

It was so obvious that she was lying. Inga Gerstendorf was even worse than Karl-Otto Launicke with her ridiculous lies. She was really annoyed to death. A few months later I heard that she had died of liver cancer. Evil returns to evil and once again it bounced off me.

Alfred Leiser and Irene - two good people

Normally I would not have been able to pay for these two good lawyers. I had cured Alfred Leiser of his Parkinson's disease. He got in touch when he heard about the lawsuit and then I got a text message: We are supporting you with 50,000 euros for your lawyers so that you can get the best lawyers. So the patients saved by the disease are saving their saviour. Good comes back to good.

After the testimony of two more witnesses, it was clear that the plans of the traitors and malicious money-grubbers did not work. The case was already closed or acquitted by then. It just took a while for the case to be dropped under another pretext. After all, they did not want a scandal about the background of the attempt to destroy me as a good doctor. Now that the case has been dropped, I have a clean slate in Germany and around the world. So good does come back to good, even if it sometimes takes a while.

Mainstream media is always one-sided

All over the mainstream media, headline after headline was printed or shown on TV: "Fraudulent doctor jailed for 10 years." None of this happened. Afterwards, whenever I walked through the streets of Magdeburg and was greeted as the needle doctor, people would ask me: "Well, how did the trial turn out? There was nothing in the media. Supposedly you were a criminal". Everyone rejoiced with me, and word quickly spread around town that the media had simply lied. Good things come to those who wait.

How the patients wanted to beat up Professor Oertel in court

Professor Oertel, hailed by the pharmaceutical industry as the Parkinson's guru, was busy writing to all doctors that Doctor Werth's method did not help with degenerative nerve diseases. I happened to be in Hannover with my lawyers when I received the letter from a colleague. My lawyers then issued a warning. The professor did not react. In his home town of Marburg, he was even vindicated. Now I began to do something about it. Together with one of my lawyers from Hannover, we took legal action and the case went to court in Kassel. Kassel was the second court of appeal. When I go to war, I win. I learned that from a book by Napoleon. Although it was not always good. But now it was time to victoriously defend a good cause.

I invited 40 successfully treated patients and appeared with them as the opposing party in court. All the patients confirmed that Doctor Werth's treatment had helped them. Professor Oertel listed all his functions before the court. The judge said: "Yes, that may be so. But it is not important here. You have the burden of proof. All 40 patients have confirmed that he helped them. And if it had been just one, you would have had to withdraw your claim. Unfortunately, we have to condemn you now. We adjourn for deliberation."

During the break, the patients asked the so-called guru of the Parkinson's scene: "You also distribute money for research by the pharmaceutical industry. Why can't you give money to the research that Doctor Werth wants to do?" "I'm not interested in what he does," the professor replied flatly. At that point, a persistent discussion on the part of the patients relaxed with such words: "What kind of doctor are you if you are not interested in our health?" This argument led to a scuffle and, by a hair's breadth, to a brawl in the courtroom. Quick-witted, Professor Oertel's lawyer pulled him backwards out of the courtroom by the back of his jacket and slammed the door. This prevented the courtroom brawl. Evil comes back to evil.

600 indictments from the system and the vestiges of corruption removed

A few weeks ago, the chief of police of a town in northern Germany came to see me as a patient. He had read about the 600 accusations allegedly made against me by patients on the internet. He said to me: "I have requested all the documents that exist about you and your alleged crime. But everything has disappeared, and I have received nothing." I said: "Obviously, corruption has made all the documents disappear as well." He asked me where this wicked lie came from. I told him that the policeman who searched the house, Mr Lindner, had written the reports himself. Patients who told him that they were completely satisfied with me and would never complain against me were also counted as complainants at that time. Lies don't always have short legs, as the saying goes, sometimes they take a little longer to come out. Nevertheless, for the time being, I have no desire to deal with such freaks. For evil always comes back to evil, even if only after death.

One of the dPV's latest inflammatory articles

One of the last inflammatory articles published by the German Parkinson Association (dPV) says that the board is happy that I only practise in Spain because that way not so many members come to see me. What is not said is that they are happy because in this situation they can better look after the pharmaceutical industry and its sales, from which they also profit. That they profit from this is written in the so-called "Black book of the dPV", the authors of which have since been silenced.

Professors Reichmann and Storch are quoted in the inflammatory article because, even before Professor Oertel's conviction, they had written a letter to the dPV stating that it was impossible that such tiny needles could help against such serious illnesses as Parkinson's disease. There is a reason for the saying: Many enemies - much honour. Much excitement is also proof of efficacy.

When marriage was a relationship of convenience

My marriage in Valencia was, from the point of view of my ex-wife Victoria S., a relationship of convenience. You don't always see it in the face of witches and devils, because evil knows how to disguise itself as good and can deceive by any means. Later I realised that she had sided with the money-grubbing devils. Thank God I am divorced now and all the witches and devils get their punishment there, because only patients come there who do not realise that there is no expertise there. So the number of patients in Valencia is slowly but surely dwindling and the money grubbers have no chance of surviving much longer without my knowledge and skills. But evil returns with a backhand.

My liberation through great love

My marriage had broken up long ago because I had been betrayed both financially and sexually. But the fortune teller Michaela had predicted it: Just wait, true love will come. One day I met my beloved. We met in Hamburg, where I was supposed to do the Alzheimer's study with some professors, but the Mafia had stopped for no reason, shortly after I had been granted a licence to practise medicine.

We were in a nice Italian restaurant, telling each other about our lives. We were on the same wavelength and the similarity of our lives was amazing. After dinner, without realising it, we walked hand in hand to her car. It was as if we had always been together. In a short time, the spiritual similarity connected us so much that we agreed to meet around Christmas and New Year's Eve. We agreed that we had to put an end to everything else because we were not put on earth to be exploited and oppressed forever.

One day, in my flat near Valencia, my beloved packed 10 suitcases and said: „We're leaving, you will no longer be exploited.

Only love counts for the Forever Needle

I could write and tell much more about the novel of the Forever Needle. There are stories without end. But one thing has always been true: The Forever Needle rewards the good and punishes the evil and the greedy. We saw this in the criminal trial orchestrated by the wicked. I have seen it again and again in hundreds of other stories. Greed, envy, hatred, malice and even cowardice are always punished and fail because of the energy of the Forever Needle. Good always comes back to good: A good heart, a good spirit, and a deep compassion for suffering patients or people lead to more and more insights into the world. They can enable us to be happy by making others happy. As the ancient Greek philosopher Plato said, the sun represents good and makes the world knowable.

In the end, we outlive our enemies

The latest news from the dPV (German Parkinson's Association) says the board has had to resign and board chairman Mehrhof has been charged with fraud. Professor Oertel is retired and has nothing more to say.

The Forever Needle in other diseases

In principle, the Forever Needle Therapy can help almost everywhere. There have been positive experiences with many diseases, including diseases after gene injection and hereditary diseases. Even if your illness or the illness of a relative does not appear on this list, it does not mean that Werth Therapy cannot help. Please ask Doctor Werth personally on the telephone number 0034 691 85 05 66.

Where the therapy does not help (anymore):

- In osteoarthritis of the joints, bones rub against each other in the joint. So if the cartilage in between is completely missing. Then no more cartilage can regenerate because none is there. It is the same in other parts of the body: If there is nothing, nothing can grow.
- In the brain, dead tissue (encephalomalacia) or scar tissue prevents regeneration. In addition, the total outflow obstacles of the brain water (Liquor cerebrospinalis).

There are positive experiences with these diseases:

Addictions

Abuse and dependence on alcohol and drugs, gambling addiction, smoking cessation, binge shopping

Allergies and autoimmune diseases

Hay fever, food allergies, Hashimoto's thyroiditis

Child and adolescent psychiatry

Early childhood brain damage, ADHD, ADS, learning disorders, spastic paralysis without a tangible cause, hereditary diseases

Diseases of the cerebellum and the extrapyramidal system

Dizziness and balance disorders of various causes, essential tremor and other tremor disorders, restless legs, Tourette's syndrome, disorders of the involuntary motor functions

Disorders of perception

Disorder of smell, disorder of taste, disorder of vision, disorder of hearing

Disorders of the autonomic nervous system

High blood pressure, low blood pressure, tendency to collapse

Eating disorder

Obesity, anorexia, bulimia

Eye diseases

Glaucoma, macular degeneration, dry eyes, ocular motility disorders

Gastric and intestinal diseases

Crohn's disease, ulcerative colitis, reflux oesophagus, dysphagia, constipation, diarrhoea

Gynaecology, obstetrics, hormone disorders

Menstrual disorders (hyper-, hypo-, amenorrhoea), unfulfilled desire to have children, menopausal symptoms, breast augmentation in the case of hormone disorders, overactive and underactive thyroid, insulin resistance, attempts at endometriosis, libido disorders

Headache

Migraine, cluster headache and other types of headache

Hereditary diseases

Hereditary diseases can be influenced

Lung diseases

COPD, bronchial asthma, allergic asthma, pulmonary fibrosis, aphonia

Mental disorders

Depression, aggressiveness, anxiety with panic attacks, obsessive-compulsive disorders, stress, burnout, sleep disorders

Musculoskeletal disorders

Polyarthritis, arthrosis of the various joints, arthritis, neuralgia, back pain, cervical spine problems, sciatica syndrome, spinal canal stenosis, shoulder-arm syndrome, vertebral artery syndrome with rotary vertigo, scoliosis, postural defects such as hunchback and widow's hump, Bechterew's disease early stage (before stiffening occurs)

Neck, nose and ear diseases

Meniere's disease, tinnitus, motion sickness (motion sickness), various types of hearing loss, Wallenberg syndrome, allergic rhinitis, balance disorders, gingivitis

Neurological diseases

Alzheimer's disease (excluding other additional brain disorders such as encephalomalacia), memory decline, dementia, frontotemporal dementia, burnout, Parkinson's at any stage, epilepsy, MS, early-stage ALS, progressive supranuclear palsy (PSP), polyneuropathy, trigeminal neuralgia, increasing paralysis, damage to various brain regions after accidents (cranial-brain trauma), unclear cases of paralysis in all body regions, Huntington's chorea and other hereditary diseases

Neuropsychological Syndromes

Motor and sensory aphasia, word-finding disorders, apraxia, agnosia, ADHD, ADS (dopamine deficiency also in children)

Pain disorders

Polyarthritis, arthroses of the various joints, arthritis, neuralgia, back pain, cervical spine problems, phantom pain after amputations, trigeminal neuralgia, sciatic syndrome, spinal canal stenosis, shoulder-arm syndrome

Prevention

Anti-ageing to stop the ageing process

Rheumatic diseases

Bechterew's disease in the early stages (before stiffening occurs), fibromyalgia, rheumatoid arthritis, joint rheumatism (polyarthritis)

Skin diseases

Psoriasis, neurodermatitis, skin allergies, skin diseases of all kinds

Urology and andrology

Enlarged prostate, frequent urge to urinate, erectile dysfunction, hormonal imbalances, incontinence, irritable bladder
